Introduction

The main purpose of the European School Survey Project on Alcohol and Other Drugs (ESPAD) is to collect data about students' substance use in as many countries as possible in order to monitor trends within as well as between countries. The first survey was conducted in 1995 in 26 participating countries and since then data have been collected every fourth year in an increasing number of countries. The fifth survey was performed in 2011 in 40 countries/entities. However, results are available from 39 since the Isle of Man collected data but unfortunately did not have the possibility to deliver any results.

This document is a supplement to the 2011 ESPAD report, which contained data from 36 countries, and includes data from Bosnia and Herzegovina (Federation of Bosnia and Herzegovina), Kosovo (under UNSCR 1244) and the Netherlands, which collected data in the autumn of 2011 whilst others did so earlier, predominately in spring. This meant that data from these countries/entity was not available for inclusion in the 2011 ESPAD Report that was published in May 2012.

Most importantly, updates with results from Bosnia and Herzegovina (Federation of Bosnia and Herzegovina), Kosovo (under UNSCR 1244) and the Netherlands have been made to all relevant tables in the report, including the methodological tables B–L in the chapter Methodological considerations, the result tables in Appendix III and the summary table in the Summary chapter.

The summary chapter has been updated (and is the only chapter where text from the previously published report has been adjusted). Apart from the updated tables, the methodological chapter also contains a bullet point summary of general as well as country specific methodological conclusions. The chapter "Key results 2011 country by country" provides short comments, which compare results from the three countries/entity that collected data in autumn 2011 with the new total ESPAD country average for all the 39 countries/entities.

Appendix I includes acknowledgements to collaborating persons, funding agencies and supportive organisations for the additional countries/entity. Appendix II contains a description and some comments about the sampling and data collection. Appendix III includes a fully updated version of the 69 result tables previously published. Hence, new calculations of the averages are presented. For pragmatic reasons the 2011 Students Questionnaire can be found in Appendix IV.

In principle, and whenever possible, country-level data is presented in the ESPAD reports. However, due to methodological considerations, data has been reported separately for the two entities of Bosnia and Herzegovina; the Republic of Srpska and the Federation of Bosnia and Herzegovina. The decision to present data separately for the two entities was based on the fact that the survey in the Federation of Bosnia and Herzegovina was conducted in the autumn rather than the spring of 2011, rendering the average age of participants from this region much higher than the ESPAD average age and the average age of students in the Republic of Srpska.

This publication is intended to serve as a supplement to the previously published 2011 report. Therefore the texts are quite limited and the document is only digitally available. The reader is referred to the 2011 ESPAD Report for more detailed information.

Summary

Summary

The main purpose of the European School Survey Project on Alcohol and Other Drugs (ESPAD) is to collect comparable data on substance use among 15–16-year-old European students in order to monitor trends within as well as between countries. So far, five data-collection waves have been conducted in the framework of the project. The first study was carried out in 26 countries in 1995, while data collection in 2011 was performed in 40 countries/entities. However, results for 2011 are available only for 39 countries/entities, since the Isle of Man collected data but unfortunately did not have the possibility to deliver any results.

This summary presents key results from the 2011 survey in the ESPAD countries as well as findings regarding the long-term trends. An initial section gives a short overview of the methodology.

Independent research teams in the participating countries form the basis of the collaborative project. In the 2011 ESPAD data collection, nearly 105,000 students took part in the following countries: Albania, Belgium (Flanders), Bosnia and Herzegovina (Republic of Srpska and Federation of Bosnia and Herzegovina), Bulgaria, Croatia, Cyprus, the Czech Republic, Denmark, Estonia, the Faroe Islands, Finland, France, Germany (five Bundesländer), Greece, Hungary, Iceland, Ireland, the Isle of Man, Italy, Kosovo (Under UNSCR 1244), Latvia, Liechtenstein, Lithuania, Malta, Moldova, Monaco, Montenegro, the Netherlands, Norway, Poland, Portugal, Romania, the Russian Federation (Moscow), Serbia, Slovakia, Slovenia, Sweden, Ukraine and the United Kingdom.

With one exception, this updated version of the summary previously published in the 2011 ESPAD Report includes all relevant information related to the three added countries. The exception is that no new significance tests have been done for gender differences. Hence, the comments below about significant differences between boys and girls only relate to the 36 countries in the originally published 2011 report.

METHODOLOGY AND DATA QUALITY

To provide as comparable data as possible, the surveys are conducted with common questionnaires and according to a standardised methodology. Data are mainly collected during the spring, and the 2011 target population was students born in 1995, with a mean age of 15.8 years at the time of data collection.

Data are collected by group-administered questionnaires. The students answer the questionnaires anonymously in the classroom with teachers or research assistants functioning as survey leaders. The 2011 samples of classes are nationally representative, except in three cases: in Belgium the study was performed in the Dutch-speaking part (Flanders) only, in

Germany only five out of sixteen federal states (Bundesländer) participated, and data collection in the Russian Federation was restricted to the city of Moscow.

The content of the present international report is based on standardised country reports and data sets delivered to the ESPAD Coordinators and Databank Manager. A few countries have experienced modest problems of a methodological kind, but not of such a magnitude as to seriously threaten the comparability of the results, and the overall validity is deemed to be high for most countries even though it should be recognised that the national cultural context in which the students have answered the questions has most certainly varied. As a precautionary measure related to low school-participation rate, the comparability of data from the United Kingdom has been deemed to be limited. Due to a higher average age than in other countries/entities, the same has been done for Bosnia and Herzegovina (FBIH).

National sample sizes were most often close to or above the number of classes that should make it possible to reach the recommended number of 2,400 participating students. Exceptions to this are the smallest countries, where the numbers were smaller even though all relevant students were surveyed.

Small differences in point estimates between countries or over time should be interpreted with caution. Changes within countries between 2007 and 2011 have been tested for statistically significant differences, while changes below four percentage points between previous data collections are not recognised as real changes. Differences in 2011 between boys and girls have also been tested for statistically significant differences at the country level for the 36 countries in the main report.

Results from 2011 for eight key variables are presented in a summary table below, in which significant decreases compared with 2007 are marked with green and corresponding increases with red.

CIGARETTES

A small number of questions regarding cigarette smoking are asked at the beginning of the questionnaire. In the 2011 survey, on average, 54% of the students in participating countries reported that they had smoked cigarettes at least once and 28% that they had used cigarettes during the past 30 days. Two per cent of all students had smoked at least a packet of cigarettes per day during the past 30 days.

The ranking orders of countries for lifetime use and relatively recent use (past 30 days), respectively, are more or less the same. High-prevalence countries for cigarette use in the past 30 days include Bulgaria, Croatia, the Czech Republic, France, Latvia, Monaco and Slovakia (at around 40%) and the low-prevalence countries are Albania, Iceland, Kosovo (under

UNSCR 1244), Montenegro and Norway (at around 12%). There is no obvious geographical pattern to be seen.

In countries where more students smoke, students are also more likely to report that cigarettes are easily obtainable. An early smoking debut (age 13 or younger) is associated, at the aggregate country level, with high levels of use in the past 30 days. On average, 7% of the students said that they had smoked cigarettes on a daily basis at the age of 13 or younger.

At the aggregate country level, the sex differences in 2011 are negligible for smoking in the past 30 days while a small gap, with more boys who are smokers, was visible in 1995 and 1999. However, in individual countries large sex differences may be observable in 2011 as well. There were significant differences between boys and girls in eleven countries, with higher figures for boys in six and for girls in five. For example, boys were about 16 percentage points above girls in Albania, Cyprus and Moldova while, conversely, girls were about 15 percentage points above boys in Bulgaria and Monaco.

In the countries for which there are data from all five surveys, a drop of 7 percentage points can be observed for past 30-days cigarette use between 1999 and 2007, but the situation remained unchanged in 2011 compared with 2007.

Between the two most recent surveys, the proportion of students who had been smoking during the past 30 days increased significantly in seven countries and fell in six. Some of the increases were fairly striking, with 13 percentage points in Monaco and 10 in Portugal. Compared with 1995, the countries with the largest decreases (20 percentage points or more from the start) are Iceland, Ireland and Norway. No country shows a continuous increase across the five waves.

ALCOHOL

In Kosovo (under UNSCR 1244) only 22% had ever used alcohol. In all other ESPAD countries but Iceland, at least 70% of the students have drunk alcohol at least once during their lifetime, with an average of 85% in the 2011 survey. The corresponding average figures for use in the past 12 months and the past 30 days are 77% and 56%, respectively. For all three time frames, there were small decreases from 2003 through 2007 to 2011. Of course, these averages are based on highly divergent country figures. For example, alcohol use during the past 30 days was reported by more than 75% of the students in the Czech Republic and Denmark, but only by 10% in Kosovo (under UNSCR 1244), 17% in Iceland and 32% in Albania. There is no clear geographical pattern but countries with relatively small proportions are mainly found among Nordic and Balkan countries.

The national average figures for lifetime, past-12-months and past-30-days prevalence are about the same for boys and girls, but when differences occur the prevalence is nearly always higher among boys. To give an example: In 15 countries there are significantly more boys than girls who have been drinking during the past 30 days, while girls are in the majority only in three (Iceland, Latvia and Sweden). Moreover, when it comes to more frequent drinking within each time frame, the proportions are usually higher among boys.

Of the students who reported the amounts of various beverages that they consumed during the most recent day on which they drank alcohol, the estimated average consumption differed between the sexes, with boys drinking one third more than girls (2011 averages of 5.8 versus 4.4 centilitres of 100% alcohol). A significant difference in this direction can be found in nearly all countries. However, in a couple of countries (Iceland and Sweden) the average quantities were about the same among girls as among boys. In a large majority of the countries, beer is the dominant beverage among boys. Spirits is the most important beverage among girls in just over half of the countries. On average, these two beverages together account for about 70% of the students' total consumption.

There are huge differences between countries. On their most recent drinking day, Danish students, on average, drank more than three times as much as students in Albania, Moldova, Montenegro and Romania. Large quantities are mainly found among students in the Nordic and British Isles countries, while countries with smaller quantities often are located in south-eastern Europe. The average quantities consumed on the latest drinking day were about the same in 2011 as in 2007. At the national level, however, they increased significantly in 2011 in ten countries but dropped in only four.

On the country level, there is no (statistical) correlation between the proportion of students in a country who had been drinking during the past 30 days and the amounts consumed on the latest drinking day. This means that both high and low average levels of consumption in volume terms can be found in countries with either high or low drinking frequencies.

There is a strong association on the country level between reported alcohol consumption on the latest drinking day and the perceived level of intoxication on that day. Thus, in countries where students reported that they consumed larger quantities of alcohol they also reported higher levels of intoxication.

Another way of measuring drunkenness is to ask how often the students had consumed five drinks or more on the same occasion during the past 30 days. This measure of "heavy episodic drinking" has undergone one of the most striking changes among girls across the ESPAD waves, with the aggregate-level average increasing from 29% in 1995 to 41% in 2007. In the 2011 survey, however, this figure has dropped to 38%. Among boys, the figure is also slightly lower in 2011 (43%) than it was in 2007 (45%) and thus also relatively close to the 1995 figure (41%).

The average gender gap has shrunk from 12 percentage points in 1995 to 5 in 2011, but even in the latest survey significantly more boys than girls reported heavy episodic drinking in 22 of the ESPAD countries. However, in one country (Sweden) the proportion was significantly higher among girls. Another three of the Nordic countries (Finland, Iceland and Norway) belong to the group of ten ESPAD countries in which the figures in 2011 were about the same for girls as for boys. The other countries in this group are the two British Isles countries (Ireland and the United Kingdom (limited comparability)), the neighbouring countries of France and Monaco, and a few other countries in different parts of Europe (Belgium (Flanders), Estonia and the Russian Federation (Moscow)).

Two Nordic countries are at opposite ends of the scale when

a) Having five or more drinks on one occasion. A 'drink' is a glass/bottle/can of beer (ca 50 cl), a glass/bottle/can of cider (ca 50 cl), 2 glasses/bottles of alcopops (ca 50 cl), a glass of wine (ca 15 cl), a glass of spirits (ca 5 cl or a mixed drink).

b) Includes amphetamines, cocaine, crack, ecstasy, LSD or other hallucinogens, heroin and GHB.

c) In order "to get high".

d) Due to lack of comparable 2007-data this comparison is made with 2003-data, highlighting differences greater than 3 percentage points.

Decrease No change Increase No comparison

it comes to heavy episodic drinking. The proportion of students in Iceland who reported in 2011 that they had engaged in this behaviour during the past 30 days was 13%, while it was more than four times higher in Denmark (56%). A look at the map does not indicate any clear geographical pattern.

Between the two most recent surveys, the figures for heavy episodic drinking increased significantly in four countries (Cyprus, Greece, Hungary and Serbia) while a significant fall can be seen in 11 countries with comparable data, including the four Nordic countries of the Faroe Islands, Iceland, Norway and Sweden. The largest increases, of about 10 percentage points, happened in Cyprus and Hungary, while the largest decreases, of 9 percentage points, took place in the Faroe Islands and Iceland.

On average, nearly six in ten students had consumed at least one glass of alcohol at the age of 13 or younger and 12% had been drunk at that age. This reply was given, on average, by more boys than girls, and that tendency was the same in almost all countries.

A number of students reported having had problems during the past 12 months linked to their alcohol consumption. The types of problem most commonly reported were “performed poorly at school or work” and having had serious problems with friends (12% each). Countries where many students reported problems related to their alcohol consumption include Bulgaria, the Czech Republic, Latvia and Slovakia.

Most alcohol-related problems are more common, on average, among boys. This is most pronounced in the cases of “physical fight” and “trouble with the police”. However, for some of the problems the averages are about the same for both sexes, including “performed poorly at school or work” and having experienced serious problems with parents or friends.

ILICIT DRUGS

Nearly one in three (29%) of the students in the ESPAD countries perceived cannabis to be (fairly or very) easily available. However, there are huge differences between countries, with the proportion ranging from 59% in the Czech Republic to 6% in Moldova. Boys are slightly more likely than girls to consider cannabis to be easily obtainable (33% versus 27% in 2011), and this tendency is also found in most individual countries, with significantly higher figures for boys in 24 of them. Amphetamines and ecstasy are not considered to be as readily available as cannabis.

An observed upward trend between 1995 and 2003 in lifetime use of illicit drugs came to a halt in 2007, when the country average was about 2 percentage points below the one in 2003, and has stayed at the same level in 2011. In 1995, 11% of the students reported lifetime use of illicit drugs. The corresponding figure in 2011 was 18). Between 2007 and 2011, the proportion of students who had tried cannabis increased significantly in eleven countries and fell in six. The most striking increases happened in France and Monaco (8–9 percentage points) while the largest decrease was found in the Russian Federation (Moscow) (11 percentage points). There is no geographical pattern and both increases and decreases can be seen in high-prevalence as well as low-prevalence countries.

On average, 21% of the boys and 15% of the girls have tried illicit drugs at least once during their lifetime, according to the 2011 survey. Boys have been clearly more likely to have done this in all surveys; in the latest wave, significantly higher figures for boys were found in more than two thirds of the ESPAD countries.

Reported use of illicit drugs varies considerably across the countries. In the Czech Republic, almost half (43%) of the students admitted to such use, and relatively many students (about 39%) did so in France and Monaco. By contrast, only around 5% reported illicit drug use in Bosnia and Herzegovina (Republic of Srpska), the Faroe Islands, Kosovo (under UNSCR 1244), Moldova, Montenegro and Norway. Lower prevalence rates are often found in south-eastern Europe, including many Balkan countries, and among the Nordic countries.

The vast majority of the students who have tried illicit drugs have used cannabis. Lifetime cannabis use was reported by 16% of the students in 2011 while 6% had tried one or more of the other drugs included in the illicit-drugs index. Ecstasy and amphetamines share second place (3% each) while cocaine, crack, LSD and heroin were less commonly reported (1–2%). Belgium (Flanders), Bulgaria, France, Latvia, Monaco and the United Kingdom (limited comparability) are the top countries in 2011 as regards lifetime use of any illicit drug other than cannabis, with prevalence rates around 10%. On average, more boys than girls have tried illicit drugs other than cannabis: 7% versus 5% in 2011. The figures are also significantly higher for boys in 14 countries, even though there is one country, Monaco, where significantly more girls reported this.

As mentioned above, cannabis is by far the most frequently used illicit drug. Lifetime experience was reported by more boys than girls on average, with 19% versus 14% in 2011, and the figures were significantly higher for boys in 27 countries. There is a huge gap between the top countries – the Czech Republic (42% in 2011), France and Monaco (about 38% each) – and the bottom ones – Kosovo (under UNSCR 1244) with 2% and Albania, Bosnia and Herzegovina (Republic of Srpska), the Faroe Islands, Moldova, Montenegro and Norway (4–5% each).

Cannabis use in the past 12 months was reported by 13% of all students, with 15% among boys and 11% among girls, while use in the past 30 days was claimed by 8% of the boys and 5% of the girls (7% average). In most countries (27 in 2011), significantly more boys than girls have used cannabis in the past 30 days. In the two highest-prevalence countries (France and Monaco), more than one in five students reported cannabis use in the past 30 days, but only 1–2% did so in Albania, Bosnia and Herzegovina (Republic of Srpska), the Faroe Islands, Kosovo (under UNSCR 1244), Moldova, Norway and Romania.

The relatively high prevalence of cannabis use among young people in Europe raises the question of potential negative consequences for individuals and society. An optional module of the questionnaire, the CAST scale, was used to estimate the risk of cannabis-related problems in the 13 (out of 36) ESPAD countries that provided the relevant data. Overall, one in three past-year cannabis users (33%) in 2011 was classified as running an elevated risk of developing cannabis-related problems.

The total proportion of high-risk users in the overall national samples ranged from 1% to 9% across countries, with an average of 5%.

There are only a few countries where the proportion having tried illicit drugs is lower in 2011 than it was in 1995. The most prominent case is Ireland, where 37% had tried in 1995 but only 19% in 2011. A drop between the same years from 12% to 7% can be seen in the Faroe Islands, while the figure for the United Kingdom decreased from 42% in 1995 to 29% in 2007.

The overall impression is that the increase in the use of illicit drugs between 1995 (11%) and 2003 (20%) observed among the ESPAD countries came to a halt in 2003, since the average prevalence was then 18% both in 2007 and in 2011.

OTHER SUBSTANCES

Lifetime non-prescription use of tranquillisers or sedatives is most commonly reported in Lithuania, Monaco and Poland – where about 14% of the students indicated such use in the 2011 survey – while the lowest levels are reported by students from the Faroe Islands, Germany (five Bundesländer), Liechtenstein, Moldova, the Russian Federation (Moscow) and Ukraine (2%). On average, more girls than boys report non-prescription use of these medical drugs (8% versus 5% in 2011) and this tendency can also be seen in most countries, with girls showing significantly higher figures than boys in 18 countries in the latest survey. The overall figure has been fairly stable between 1995 and 2011 (at around 7–8%), even though there were significant increases between 2007 and 2011 in three countries and decreases in seven.

The average proportion of students having tried alcohol together with pills in order to get high is lower in 2011 (6%) than it was in 1999 (9%), and this decreasing trend can be found for both sexes. Moreover, the smallest gender gap yet is the one seen in 2011 (7% for girls versus 5% for boys).

Lifetime use of tranquillisers or sedatives without a doctor's prescription, together with mixing alcohol and pills, are the only substance-use behaviours that have been more common among girls than boys, on average, in all five data-collection waves.

Over the years since the first survey in 1995, lifetime-prevalence rates for the use of inhalants did not change very much until 2007, with averages at the aggregate level of 8–9%. However, a slight increase from 8% to 10% can be seen between the two most recent surveys. Boys have previously been 1–2 percentage points above girls, but in 2011 both sexes reported the same proportion (10%). This has never happened before.

In nearly half of the countries (15 out of 34) with comparable data in 2007 and 2011, a significant increase in the lifetime prevalence of inhalants can be seen, while a significant drop occurred in eight countries. One of the most striking decreases happened in the former top country of Cyprus, where the proportion of students having tried inhalants was reduced by half from 2007 (16%) to 2011 (8%). There are also pronounced increases between the two latest surveys. One example is Croatia, with an increase from 11% to 28%, and another is

Latvia, which went from 13% to 23%, making these two the top countries in 2011. At the other end, with the lowest figures, are Kosovo (under UNSCR 1244) and Moldova with 1–2%.

Polydrug use is analysed in a special chapter of the report. The situation in 2011 is relatively stable compared with that in 2007. The overall prevalence of polydrug use (involving two or more substances) in the total sample from the 29 countries with comparable data was close to 9% in both surveys. This is similar to, or even higher than, the figures for use of illicit drugs other than cannabis. The prevalence of use of three or more substances was 3.5% in each survey. Polydrug use is associated with deviant behaviour, which is here represented by having had trouble with the police, having been involved in a physical fight, having had sexual intercourse without a condom and skipping school.

None of the substances commented in this section show any clear geographical pattern.

FINAL REMARKS

It is well known that, at the individual level, there is often a relationship between the use of different substances. In the 2011 data, there are also apparent associations between the use of different substances at the aggregate country level: it can be concluded that in countries where many students report recent (past-30-days) alcohol use and heavy episodic drinking, more students are likely to report experience with illicit drugs and inhalants, and vice versa.

Eight key variables give an overview of the 2011 results per country: cigarette smoking during the past 30 days, consumption of any alcoholic beverage during the past 30 days, alcohol volume (100% alcohol) consumed on the latest drinking day, heavy episodic drinking during the past 30 days, lifetime use of marijuana or hashish (cannabis), lifetime use of any illicit drug other than cannabis, lifetime non-prescription use of tranquillisers or sedatives and lifetime use of inhalants.

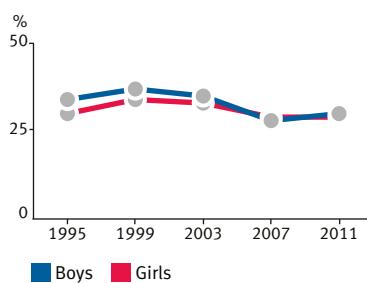

The individual countries' prevalence rates for the eight key variables are compared with the averages for all countries. Countries that often score close to the average are Poland and Portugal. Low-prevalence countries are Iceland and the neighbouring countries of Albania, Bosnia and Herzegovina (Republic of Srpska), Kosovo (under UNSCR 1244), Moldova and Montenegro. It is more difficult to identify high-prevalence countries, and no single country is above average for all measures. However, countries that could be mentioned in such a context in 2011 are the Czech Republic, Estonia, France, Latvia, Monaco and Slovenia. No obvious geographical clusters are apparent.

The overall substance-use trends for all the countries with data from all five waves display a slightly different development depending on the variable in focus. As regards cigarette use in the past 30 days, there was a decrease between 1999 and 2007, and then unchanged figures in 2011.

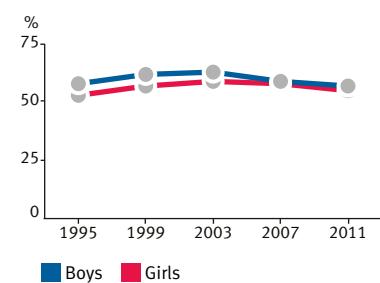

A slight reduction since 2003 can be seen for use of alcohol during the past 30 days. An upward trend was notable for heavy episodic drinking throughout 1995–2007 (an increase of 9 percentage points), mostly explained by increasing prevalence

Summary Figure. Trends for eight key variables by gender.

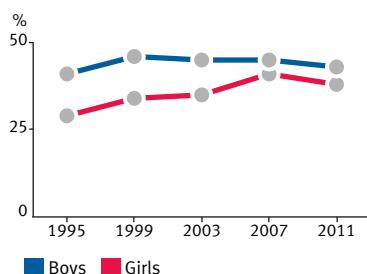

1995–2011. Average percentages (if otherwise not indicated) for the 14–27 countries providing trend data.

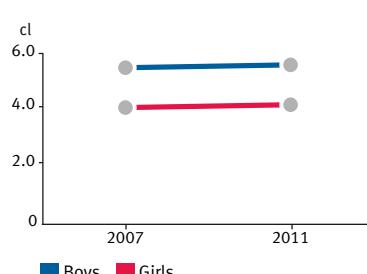

Cigarette use during the past 30 days.
Averages for 19 countries. Percentages.

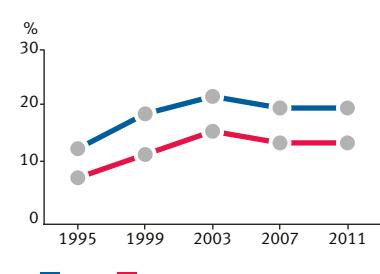

Use of any alcoholic beverage during the past 30 days. Averages for 18 countries.

Proportion reporting having had five or more drinks on one occasion during the past 30 days. Averages for 14 countries. ("A 'drink' is a glass/bottle/can of beer (ca 50 cl), a glass/bottle/can of cider (ca 50 cl), 2 glasses/bottles of alcopops (ca 50 cl), a glass of wine (ca 15 cl), a glass of spirits (ca 5 cl or a mixed drink).")

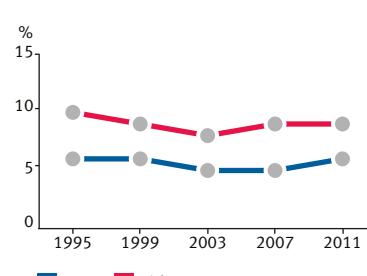

Estimated average alcohol consumption during the last alcohol drinking day among students reporting any last day alcohol consumption. Averages for 27 countries.
(Centilitres 100% alcohol.)

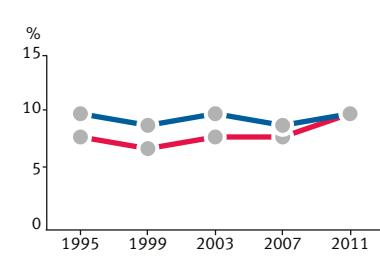

Lifetime use of marijuana or hashish.
Averages for 19 countries.

Lifetime use of illicit drugs other than marijuana or hashish. Averages for 19 countries.
(Includes amphetamines, cocaine, crack, ecstasy, LSD or other hallucinogens, heroin and (since 2007) GHB.)

Lifetime use of tranquillisers or sedatives without a doctor's prescription. Averages for 19 countries.

Lifetime use of inhalants. Averages for 17 countries.

rates reported among girls in a number of countries. However, this trend seems to have come to a halt since the 2011 figures show slight reductions among boys as well as girls.

The upward trend between 1995 and 2003 for lifetime use of illicit drugs – predominantly cannabis – has also come to a halt; the 2007 and 2011 figures are 2 percentage points below the 2003 figure. Experience with any illicit drug other than cannabis increased from 1995 to 1999, but has been fairly stable after that.

Lifetime non-prescription use of tranquillisers or sedatives displays hardly any changes at all across the five waves. The same is true for inhalants, even though the 2011 figure is slightly higher than the 2007 one.

With one exception – non-prescription use of tranquillisers or sedatives – the figures for the key variables were higher for boys than for girls in the first survey wave. However, this gender gap had more or less disappeared by the time of the 2011 survey for cigarette and alcohol use during the past 30 days as

well as for lifetime use of inhalants. A noticeable reduction in the gender gap can also be seen for heavy episodic drinking during the past 30 days.

However, trends in individual countries diverge from the overall impression, as can be seen from the colours in the summary table for the eight key variables. When it comes to recent changes from 2007 to 2011, students in Bosnia and Herzegovina (Republic of Srpska) show lower figures in 2011 than in 2007 for all eight key variables. Other countries with a relatively large number of reductions include Malta with lower figures in 2011 for six variables, and Iceland, Norway and the Russian Federation (Moscow) with lower figures for five. In the cases of Iceland and Norway, this includes all alcohol-related variables, while both lifetime use of cannabis and lifetime use of any illicit drug other than cannabis have decreased in Malta and the Russian Federation (Moscow).

In Iceland, this is a continuation of trends seen in earlier surveys which have put Iceland in a leading position when it comes to low alcohol consumption and abstinence from different substances.

Significant increases for six of the eight key variables can be seen in Cyprus and for five of them in Greece, Hungary and Montenegro. Cypriot students reported more use of alcohol and of illicit drugs in 2011 at the same time as the proportion of them who had used inhalants fell to half. The increases in Greece and Hungary included heavy episodic drinking as well as the quantities consumed on the latest drinking day. The increases in Montenegro mainly started from relatively low levels observed in the previous survey.

The key variable with the largest number of countries (15) reporting significantly higher figures in 2011 than in 2007 is inhalants. Other variables with a relatively large number of countries increasing between the two most recent surveys include lifetime use of cannabis (11) and average alcohol consumption during the latest drinking day (10).

The key variables with the largest numbers of countries reporting significantly lower figures in 2011 than in 2007 include

alcohol use during the past 30 days and heavy episodic drinking during the same period (12 and 11 countries respectively).

A look at the whole period from 1995 to 2011 with a focus on three variables (heavy episodic drinking, lifetime use of cannabis and lifetime use of illicit drugs other than cannabis) reveals that, compared with 1995, the figures in most countries are relatively unchanged or higher in 2011. The most pronounced increases in heavy episodic drinking, in terms of percentage points, are found in Croatia, Hungary, Slovak Republic and Slovenia (21–30 percentage points). The biggest increases for lifetime cannabis use are found in the Czech Republic (with the main increase until 2003), Estonia (mainly until 2003) and Slovak Republic (even though its 2011 figure is significantly lower than the 2007 one) (17–20 percentage points). With some exceptions, these countries are located in the eastern part of Europe.

A reduction between 1995 and 2011 in heavy episodic drinking in the past 30 days is mainly found in Iceland (23 percentage points), but also in Finland (until 2007) and Ukraine (16 percentage points each). Lifetime use of cannabis has fallen by 19 percentage points in Ireland and by 12 in the United Kingdom (until 2007). These two are also the only countries with important decreases for lifetime use of any illicit drug other than cannabis, with 13 percentage points in the United Kingdom (from 1995 to 2007) and 10 in Ireland. With the exception of Ukraine, these countries are located in western Europe.

There are of course more examples of (groups of) countries moving in a similar direction than those commented on above; one example is the reduced alcohol consumption in some of the Nordic countries. There are thus a great many additional opportunities for analysing ESPAD data, and it is hoped that ESPAD researchers, as well as colleagues from other countries, will use the ESPAD databases even more in the future to expand our knowledge about young Europeans' use of different substances.

Methodological considerations

Methodological considerations

INTRODUCTION

In this supplement to the 2011 ESPAD Report results are based on 39 national surveys using the common methodological guidelines presented in the ESPAD Handbook. The chapter “Methodological considerations” in the main report provides an overview of the issues of representativeness, reliability and validity in the 2011 ESPAD survey. Reference to previous data-collection exercises is made whenever necessary. The chapter ends with a short summary of the most important methodological issues to be taken into consideration.

The first ESPAD survey in 1995 was the first school survey on alcohol and drug use ever to be carried out in several of the participating countries. For the fifth ESPAD study in 2011, greater experience and long-lasting co-operation have contributed to a more robust and standardised methodology. While there remain some discrepancies and areas of concern that need to be addressed, it should be stressed that, from an overall perspective, the ESPAD project has attained high levels of representativeness, reliability and validity.

The content of the methodological chapter in this document mainly consists of updated versions of the methodological tables, which are not commented upon. The only text part is a summary of general and country-specific conclusions.

GENERAL AND COUNTRY-SPECIFIC CONCLUSIONS

Given the extensiveness of the methodological discussion in the previously published 2011 report about representativeness, reliability, validity and comparisons with other survey data, the most salient conclusions are summarised below (not in order of importance).

GENERAL CONCLUSIONS

- The overall impression is that, taken together, the methodological problems in the 2011 ESPAD data-collection exercise are small or limited.
- With two exceptions, no country experienced methodological problems of such a serious nature that the comparability of its results with data from other countries was called into question.
- The figures for drug use probably represent an underestimate to some extent, and the level of under-reporting appears to differ somewhat between countries. However, it is not likely that the qualification of countries as either high-prevalence or low-prevalence ones could be called into question on the basis of differences in under-reporting between countries.
- Despite some differences in cultural context, the validity of the ESPAD survey is assumed to be high.
- The report does not provide confidence intervals for indi-

vidual figures. It is therefore important to use caution when interpreting differences between point estimates. When it comes to trends, this is important for comparisons with and between earlier surveys, since those differences, in contrast to changes between 2007 and 2011, have not been tested for statistically significant differences.

- Individual countries suffer from methodological problems that should be taken into account when their figures are analysed. These problems are briefly reviewed below under “Country-specific conclusions”.
- The magnitudes of the figures for various kinds of substance use in different ESPAD countries probably reflect country differences quite well, especially as between distinct groups of countries with different overall levels of student experience with various types of substance use.
- It is more important to concentrate on the magnitudes of the estimates than on absolute numbers, both when analysing data from single countries and when interpreting trends and differences between countries.
- Small differences between countries should be considered carefully. They may not reflect real differences.

COUNTRY-SPECIFIC CONCLUSIONS

- **Albania:** A high rate of inconsistency, related to some technical problems with the questionnaire, has made the data on lifetime use of alcohol non-comparable. Like in some neighbouring countries, under-reporting of drug use might be higher than in most other countries. However, there is no reason to believe that Albania is not a country with a low prevalence of drug use.
- **Belgium (Flanders):** Data collection was limited to students in the Dutch-speaking part (Flanders). Comparisons in the trends chapter are therefore limited to students from Flanders. Relatively few Belgian schools participated (58%), which calls for some caution.
- **Bosnia and Herzegovina (Federation of Bosnia and Herzegovina):** The average age of participating students in the federation is much higher than in all other ESPAD countries, which indicates that data might not be fully comparable with data from other countries. As a precautionary measure related to this, data from the federation is not merged with data from the other federation (Republic of Srpska) and is shown below a line in the results tables. Like in some neighbouring countries, under-reporting of drug use might be higher than in most other countries. However, there is no reason to believe that Bosnia and Herzegovina (federation of Bosnia and Herzegovina) is not a country with a low prevalence of drug use.
- **Bosnia and Herzegovina (Republic of Srpska):** Data collection was limited to the Republic of Srpska. Like in some

- neighbouring counties, under-reporting of drug use might be higher than in most other countries. However, there is no reason to believe that Bosnia and Herzegovina (Republic of Srpska) is not a country with a low prevalence of drug use.
- **Croatia:** A relatively large proportion answered that they would be unwilling to report possible use of cannabis (17%).
 - **Cyprus:** The data collection was limited to government-controlled areas. The sampling frame covered a relatively small proportion of the target population (67%). For this reason, the results are representative only of students born in 1995 enrolled in grade 1 in public schools. A number of factors together point to some limitations in validity: the length of the questionnaire, the frequency of disturbances and other “negative” reports from the data-collection exercise (including a low number of seriously working students), a relatively high number of discarded questionnaires and a relatively high number of students who skipped core questions. Taken together, this indicates that data quality might be a little lower than in other countries, which is why comparisons with data from other ESPAD countries should be made with some caution.
 - **Czech Republic:** For pragmatic reasons (late funding for the survey) the sample of schools from 2007 was used in 2011 as well. Even though this is not an ideal way of sampling, it is assumed not to have influenced representativeness to any important degree.
 - **Denmark:** Participation rates differed between the three types of schools, which indicates that the data ought to have been weighted. Only 42% of the sampled schools took part in the survey, which gives rise to an uncertainty that should be kept in mind.
 - **France:** Like in earlier data-collection waves, the 3.5% of French members of the target population living in overseas territories and departments were excluded from the sampling frame.
 - **Germany (5 Bundesländer):** The survey is not representative of the whole country but only of the 5 (out of 16) Bundesländer that participated. Comparisons in the trends chapter are limited to the 5 Bundesländer that took part in previous surveys as well. A low proportion of participating schools (40%) and a large proportion of students who were denied permission to participate by their parents or refused themselves (14%) give rise to some uncertainty that it is important to keep in mind.
 - **Greece:** Unlike in earlier surveys, all islands were included in the 2011 sampling frame, which means that the sample in 2011 covers 100% of the population, not 94% as before.
 - **Ireland:** Students in grades 3 and 5 were undersampled and students in grade 4 were oversampled. In principle this calls for weighting, which was not done. However, a comparison as regards some key variables between students in the three grades indicates that the absence of weighting has not influenced the results to any important degree.
 - **Kosovo (under UNSCR 1244):** A large proportion of students answered that they would not admit to possible cannabis use which, together with a high proportion of unanswered questions, gives rise to some uncertainty and should be kept in mind. Hence, it cannot be excluded that under-reporting of drug use might be higher in Kosovo (under UNSCR 1244), as well as in some neighbouring countries, than in most other countries. However, there is no reason to question that it belongs to the group of countries with a low prevalence of drug use.
 - **Lithuania:** Data collection in 2011 was limited to students in grade 9, while earlier surveys had also included students in grades 8 and 10. This makes the 2011 data representative only of students born in 1995 and enrolled in grade 9. Comparison of 2007 data for students in the three grades as regards more commonly used substances indicates that it still remains feasible to make comparisons. However, less commonly used substances should be treated more carefully when comparisons are made between 2011 data and earlier data.
 - **Moldova, Republic of:** Data collection was limited to students west of the Dniester River. High rates of inconsistency, related to some technical problems with the questionnaire, have made the data for lifetime, past-12-months and past-30-days alcohol consumption and drunkenness non-comparable.
 - **Monaco:** Many of the students born in 1995 attending Monegasque schools are actually French citizens.
 - **Montenegro:** Like in some neighbouring countries, under-reporting of drug use might be higher than in most other countries. However, there is no reason to believe that Montenegro is not a country with a low prevalence of drug use.
 - **Netherlands:** Relatively few schools participated (50%), which calls for some caution.
 - **Norway:** A low proportion of participating schools (32%) is an uncertainty factor that should be kept in mind.
 - **Portugal:** The 15% of the target population who were enrolled in private schools were not included in the survey. Like in previous ESPAD data-collection waves, the 2011 survey was limited to the 95% of the target population living on the mainland. However, since previous analysis of national data has not shown any important differences between mainland and island students, this is of minor importance. Internal rates of non-response are high in some cases; whenever relevant, these are indicated in the results tables.
 - **Romania:** A large proportion of students were denied permission to participate by their parents or refused themselves (11%).
 - **Russian Federation (Moscow):** Unlike in 2007, when the sample covered the whole country, data collection in 2011 was limited to the capital, Moscow. This was the case in 1999 and 2003 as well, and since the 2007 survey included a sub-sample from the capital, comparisons in the trends chapter are limited to students from Moscow.
 - **Serbia:** Like in some neighbouring countries, under-reporting of drug use might be higher than in most other countries. However, there is no reason to believe that Serbia is not a country with a low prevalence of drug use.
 - **United Kingdom:** Only a small proportion of the sampled

schools took part in the data-collection exercise (6%). It is not possible to conclude that the UK data are not valid enough to be compared with data from other countries, and despite the circumstances an adequate sample size was still achieved through the unprecedented efforts of the UK team. However, as a precautionary measure related to the school-participation rate, UK data are shown below a line in the results tables and no comparisons are made with previous surveys in the trends chapter.

CONCLUSIONS RELATING TO NON-ESPAD COUNTRIES

- **Spain and United States:** These countries do not participate in ESPAD but carry out similar school surveys with similar questions. Whenever data are judged to be comparable, results from these countries are reported. However, since they do not use the ESPAD methodology, such comparisons definitely include a measure of uncertainty. This is emphasised by placing data from Spain and the United States below a line in the results tables.
- **Spain:** Data were largely collected in November and December 2010. Because of this, the average age of the Spanish respondents is slightly lower than the ESPAD average (15.6 and 15.8 years, respectively), which is important to keep in mind.
- **United States:** Data collection in the United States was carried out between February and June 2011. Since about 60% of the students were born in 1995 and nearly all others in 1994, the estimated average age is 16.2 years. This is above the ESPAD average of 15.8 years, a difference which is important to keep in mind.

a) Proportion of the ESPAD cohort still enrolled in regular school (not in schools/classes for students with special needs etc).

b) Calculations based on the data collection period.

c) Proportion of the ESPAD target students covered by the sampling frame.

d) Covers Flanders as well as Dutch speaking schools in the Brussels Capital region.

e) Covers Republika Srpska, which is one of 2 entities in Bosnia and Herzegovina.

f) Only government controlled areas included.

g) Geographic population coverage 99.4%: The island Åland is not covered by the sampling frame.

h) Geographic population coverage 96.5%: DOM-TOM territories (overseas departments and territories like the West Indies, Guyana, and Bourbon Island) not covered by the sampling frame.

i) Covers 5 of 16 Bundesländer: Bavaria, Berlin, Brandenburg, Mecklenburg-Western Pomerania and Thuringia. Altogether about 27% of all German inhabitants born in 1995 live in these Bundesländer.

j) This is the figure from 2007. No new information is available but there is no reason to believe that the figure would be very different in 2011.

k) Covers only schools on the right bank of the Dnieper river.

l) Geographic population coverage 95%: The Azores and Madeira islands not covered by the sampling frame.

a) One question is the self-reported lifetime prevalence question for the substance, while the second is about age at first use.

b) Quotient (a/b) of the proportion of a) students stating "I have already said that I have used it" when queried if they would have admitted cannabis use in the questionnaire (C44) and b) the proportion of students having reported lifetime prevalence of cannabis (C25a).

Key results 2011 country by country

Key results 2011 country by country

INTRODUCTION

In the chapter “The situation in 2011” in the 2011 ESPAD Report, results were compared one variable at a time. However, it is also of interest to look at the results country by country. In this chapter, eight selected key variables are therefore presented in relation to each country.

The eight key variables are (with questionnaire item label in brackets):

- Cigarette use during the past 30 days (C09).
- Alcohol use during the past 30 days (C12c).
- Heavy episodic drinking during the past 30 days, i.e. having had five or more drinks on one occasion (a drink roughly corresponds to 2 centilitres of pure alcohol) (C18).
- Volume of alcohol (in centilitres of pure alcohol) consumed during the most recent alcohol-drinking day (for students reporting any such consumption) (C15.2–6, C15a–f).
- Lifetime use of cannabis (marijuana or hashish) (C25a).
- Lifetime use of illicit drugs other than cannabis (C29a, C31b, C31c, C31d, C31e, C31g, C31i).
- Lifetime use of tranquillisers or sedatives without a doctor’s prescription (C31a).
- Lifetime use of inhalants in order to get high (with nationally relevant examples of such substances given) (C30a).

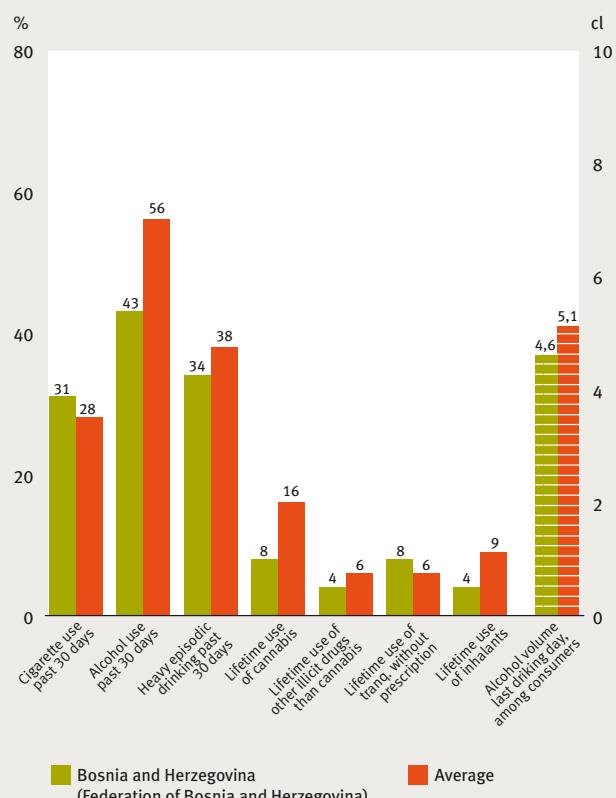

To facilitate comparisons of national prevalence rates with the ESPAD averages, the results for the three countries are shown in a chart along with the averages for all 39 participating ESPAD countries. The countries are presented in alphabetical order.

For more detailed information about each variable, please refer to the tables section (Appendix III) and the questionnaire (Appendix IV). Information about methodological aspects of the three additional countries’ national studies is presented in Appendix II.

BOSNIA AND HERZEGOVINA (FEDERATION OF BOSNIA AND HERZEGOVINA)

With two exceptions students in Bosnia and Herzegovina (Federation of Bosnia and Herzegovina) report lower levels of substance use on the key variables, compared with the ESPAD average. The levels are particularly low for lifetime use of cannabis, other illicit drugs than cannabis and inhalants. Compared with those variables, the three alcohol-related measures were closer to average but still definitely below. However, for cigarette use during the past 30 days and lifetime use of tranquillisers or sedatives without a prescription the figures are slightly higher than the ESPAD average. The overall picture of Bosnia and Herzegovina (Federation of Bosnia and Herzegovina), in the ESPAD perspective, is a little mixed with low figures on most variables but a bit above the ESPAD average on two.

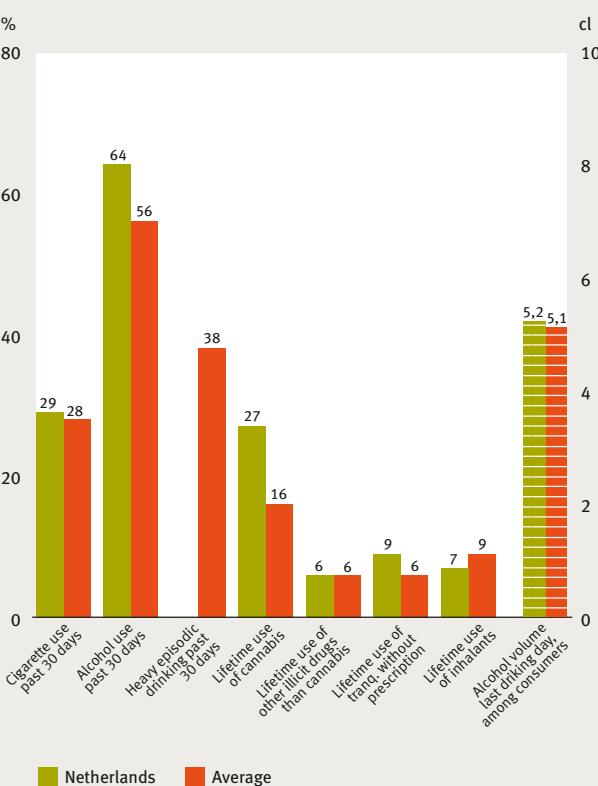

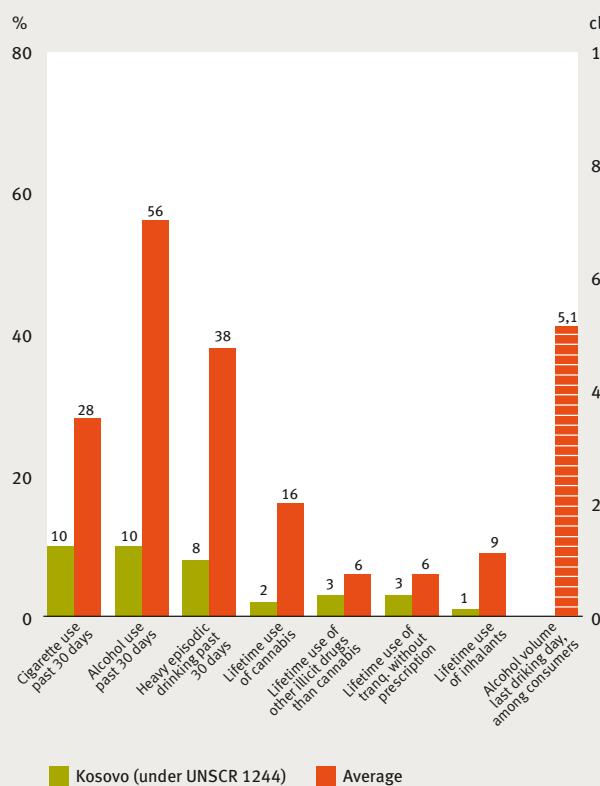

KOSOVO (UNDER UNSCR 1244)

Students in Kosovo (under UNSCR 1244) clearly report much lower levels of substance use on seven key variables, compared with the ESPAD average. Comparable data for heavy episodic drinking is missing. The students are at the bottom for all comparable variables and it is easy to summarise that Kosovo (under UNSCR 1244), in the ESPAD context, is a low-prevalence country when it comes to the use of all substances.

NETHERLANDS

Students in the Netherlands scored higher than average on alcohol use in the past 30 days as well as on lifetime use of cannabis and non-prescription use of tranquillisers and sedatives. Moreover, reported last 30 days cigarette use, lifetime use of other illicit drugs than cannabis and alcohol consumed during the last drinking day were close to average, while Dutch students scored a bit lower on lifetime use of inhalants. Comparable data for heavy episodic drinking is missing. Hence, the picture for the Netherlands is a slightly mixed one when it comes to the key indicators.

Kosovo (under UNSCR 1244): Ministry of Education, Science and Technology; Ministry of Interior; Ministry of Health

Netherlands: The Dutch Ministry of Health, Welfare and Sport; participating Regional Health Services.

APPENDIX II

Sampling and data collection in participating countries

Sampling and data collection in participating countries

This section includes a relatively detailed overview of each country's sampling design and data-collection process, as well as the results for some measures of validity and reliability. These presentations are based on Country Reports, Classroom Report data and Student Questionnaire data as well as additional dialogues with the Principal Investigators. The presentation for each of the three additional countries ends with methodological conclusions specific to that country.

The general ESPAD methodology is described in The ESPAD 2011 Report in the chapter entitled "Study design and procedures". The most important country-specific methodological facts have also been summarised above as well as in the main report, in Tables B–L of the chapter entitled "Methodological considerations". The persons and institutions that have played an important part in the national data collections are listed in Appendix I, entitled "Acknowledgements".

Country facts:

Area: 26 100 km²

Population: 4,6 (2,5) million

BOSNIA AND HERZEGOVINA (FEDERATION OF BOSNIA AND HERZEGOVINA)

Aida Pilav at the Public Health Institute of Federation of Bosnia and Herzegovina was responsible for the survey.

The Federation of Bosnia and Herzegovina is one out of two entities in the country Bosnia and Herzegovina. Originally it was planned that data from this entity, together with data from the entity Republic of Srpska, should have been presented together as data from the country as a whole. However, for pragmatic reasons this is not the case in this report, but is planned for future ESPAD reports.

An ESPAD data collection was done in Federation of Bosnia and Herzegovina also in 2008, but data were not geographically valid for all students in the target population.

ETHICAL PROCEDURES

A scientific ethical review was not necessary and parental consent was not asked for. All relevant national ethical rules were followed.

POPULATION

School in Federation of Bosnia and Herzegovina is compulsory until a person has passed secondary school, which usually happens when they are 17–18 years old. The target population was students born in 1995 that, at the time of the data collection, mainly were found in grade 2 of secondary school.

Of all persons born in 1995 it has been estimated that 75% were enrolled in school at the time of the data collection.

SAMPLE AND REPRESENTATIVENESS

The school system includes three kinds of schools (gymnasiums and colleges, comprehensive secondary schools and art schools). Schools with non-standard curricula as well as schools for children with special needs were excluded from the sampling frame. The ten cantons were stratified in four groups based on size.

For each of the strata lists of the classes were available. Within each stratum, and proportionate to the size of the stratum, classes were sampled with a systematic random sample with the same probability for all classes in a school to be sampled. All in all, the sample consisted of 196 classes in 123 schools.

Of all students born in 1995, 82% were estimated to be found in the participating grade.

FIELD PROCEDURE

The first step was an approval from the Minister of Education in each canton.

Research assistants functioned as survey leaders. After a one day training they contacted the sampled schools and agreed on a time for the data collection.

Teachers introduced the survey leader to the class but were not present in the classroom during the completion of the forms. Each student put his/her questionnaire in an individual envelope and put it in a special box.

Data were collected in November and December 2011, which gives an average age of 16.4 years.

The average time to complete the questionnaire, measured with the 2007 Classroom report, was 35 minutes.

QUESTIONNAIRE AND DATA PROCESSING

The questionnaire contained all questions in the core segment, except the optional questions about alcopops and cider, as well as one optional and one country specific question. No module or optional questions were included.

In the question about heavy episodic drinking (Q17) the example of a “drink” of beer was “ca. 33 cl” instead of “ca. 50 cl” as in the master questionnaire.

The master questionnaire was translated and back translated. The form was tested in one class, but no important adjustments had to be done.

Data were entered manually. Some internal tests indicated that the data entry was of a good quality.

SCHOOL AND STUDENT CO-OPERATION

The heads of the schools showed a great interest in the survey and only one sampled school refused to participate.

Of all students in participating classes 93% were present and took part in the survey. No student refused to participate. In the data cleaning process 1% of the questionnaires were rejected.

Three fourth (76%) of the survey leaders did not report any disturbances during data collection and about the same proportion (75%) answered that they thought that the students worked seriously. Only a small number (3%) mentioned that they thought that there were students that found the form difficult to answer.

No important problems were reported about the data collection process.

RELIABILITY AND VALIDITY

The rate of inconsistency between two questions in a single administration, which is used as a reliability measure, was highest for tranquillisers or sedatives without a doctor’s prescription (9%), followed by cigarette smoking (4%). For the remaining three variables (cannabis, ecstasy and inhalants) the figure was 1–2%.

The average number of unanswered core questions was 0.4%.

The rate of inconsistent answers to questions about lifetime use, use in past 12 months and use in past 30 days, which is used as a validity measure, was highest for alcohol consumption (4%) and “been drunk” (3%) and lower (0–1%) for the remaining three variables (cannabis, ecstasy and inhalants).

Of all students (23%) reported that they would “definitely not” have admitted to use cannabis. On the same question, 10% answered that they had already said that they had used cannabis, which is slightly higher than the reported lifetime prevalence figure (8%).

Only few students (0.5%) answered that they had used the dummy drug “Relevin”.

METHODOLOGICAL CONSIDERATIONS

For pragmatic reasons data were not collected until November and December 2011, which is about 8 months later than in most other ESPAD countries. Since the target population was not redefined related to the late data collection, but still was students born in 1995, a consequence is that the average age by far is much higher in the Federation of Bosnia and Herzegovina (16.4 years) than the ESPAD average (15.8 years). Another aspect related to this is that half of the population has experienced one more summer, when different kinds of substance use usually are higher than in other parts of the year, than other ESPAD students. To stress these important differences it has been decided to put data from the federation under a line in the result tables, indicating that data might not be fully comparable with data from other entities/countries.

In addition to this it can be mentioned that the data collection in 2008, for pragmatic reasons, was limited to the main cities in the 10 cantons. This means that data were not fully nationally representative, which also indicates that direct comparisons ought not to be done between the 2011 and 2008 data collections in the Federation of Bosnia and Herzegovina.

All classes within each of the four strata had the same probability to be sampled. This means in reality that students from small classes are oversampled. However, since it seems reasonable to assume that all classes within each stratum were of about the same size, this is not seen as an important problem.

In the question about heavy episodic drinking “ca. 33 cl” was given as an example of “a drink” of

beer instead of the “ca. 50 cl” mentioned in the master questionnaire. This was done since beer mainly is sold in 33 cl containers. Since this is about 50% less than in the master questionnaire there is a risk that figures for heavy episodic drinking are a bit overestimated since it was “easier” for a beer drinking student in the Federation of Bosnia and Herzegovina than in other countries/entities to be classified as a heavy episodic drinker.

Only one sampled school refused to participate, which indicates very good school cooperation.

No student refused to participate, the proportion of present students was high (93%) and the number of skipped questionnaires (1%) low as well as the average number of unanswered core questions (0.4%). The reports of the survey leaders do not indicate any serious problems. Hence, student cooperation seems to have been good.

The reliability inconsistency measure, comparing the answers of two questions for some variables, was high for tranquillisers and sedatives without a doctor’s prescription (9%), which create some concern about the reliability for that variable.

Further, as many as 23% of the students answered that they would “definitely not” admit to possible cannabis use. This is far above the average of 10%. Other countries reporting high figures include neighbouring countries such as Albania, Bosnia and Herzegovina (Republic of Srpska), Kosovo (under UNSCR 1244), Montenegro and Serbia. Even though the question is a hypothetical one, the figures for these countries give rise to some uncertainty and indicate that under-reporting of drug consumption might be higher there than in most other countries.

Data are representative for 1995 born students in grade 2 of secondary schools. However, since the survey was done as late as in November – December 2011 the average age was much higher than in other entities/countries. Based on this, results from the federation have been put under a line in the result tables to indicate that data might not be fully comparable with those from other entities/countries.

KOSOVO (UNDER UNSCR 1244)

Country facts:

Area: 11 000 km²

Population: 1.8 million

Mytaher Haskuka at the University of Prishtina was responsible for carrying out the study in Kosovo (under UNSCR 1244). This was the first time ESPAD data were collected in the country.

ETHICAL PROCEDURES

Permission was given by the Intra-ministerial Research Committee. Parental consent was not asked and no other ethical actions were needed. All relevant ethical rules were followed.

POPULATION, SAMPLING AND REPRESENTATIVENESS

School is compulsory until the end of secondary school. Due to the war and lack of a valid census as of 2012, no exact figures are available neither about the number of 1995 born persons living in the country nor about the number of students attending school. Hence, to be able to calculate the proportion attending school and the proportion of students covered by the sampling frame, it was necessary to use estimated figures. It was calculated that approximately 98% of all children born in 1995 were enrolled in school during the spring of 2011.

Students in grades 1–2 of secondary school were included in the sampling frame. Schools were divided in two strata (public and private schools). Since no information was available about the number of students in the schools, schools were sampled with a simple random sample within each stratum proportionate to the number of schools in the strata. In each of the sampled schools classes were randomly sampled by either including all classes with odd number or all classes with even number, which was a way of compensating for the fact that schools in the first step were not sampled proportionate to school size.

Since the data collection had to be postponed from the spring to the autumn and since two grades were included in the sample, it was possible afterwards to adjust the target population to the time of the data collection by using information about the month of birth. Based on that, the target population was redefined to be students born between 1 August 1995 and 30 July 1996.

It has been estimated that 91% of all students in the target population were to be found in the two participating grades. The sample is self-weighted and the results are nationally representative. Data are not weighted.

FIELD PROCEDURE

After the permission from the Intra-ministerial Research Committee, directors of education in the municipalities were contacted for permission. Based on this school directors were contacted to schedule the time of the data collection.

Specially trained research assistants were responsible for the data collection. They were introduced by a teacher or other school staff which thereafter left the room.

The questionnaires were answered under the same conditions as a typical written test at school, and after completion each student placed his/her form in a closed class box.

No important problems were reported from the data-collection exercise.

The study was conducted from 2 September to 5 October 2011, which gives an average age of 15.7 years.

The average time to answer the questionnaire was 43 minutes.

SCHOOL AND STUDENT PARTICIPATION

Two Serbian speaking schools in the north refused to participate, meaning that 95% of all sampled schools took part in the survey. The two refusing schools were replaced by two Serbian speaking schools in another part of the country, but have anyhow been seen as refusing. On the whole, schools were very co-operative.

In participating classes, 97% of the students were present and answered the questionnaire. No student refused to take part in the survey, but rather many questionnaires were discarded (2.6% compared with the average of 1.3%).

In general, students were considered to have co-operated relatively well. Disturbances were, however, reported from nearly two-thirds of the classes, even though these were normally caused by only a few students. A majority of the students are reported to have worked seriously (77%).

A total of 2,324 ESPAD target students are included in the final database.

QUESTIONNAIRE AND DATA PROCESSING

All core questions were asked as well as all module and optional questions. Five country specific questions were included.

The Albanian version of the questionnaire was translated and back-translated into English and no important problems were observed. The Serbian version was based on the questionnaire used in Montenegro and adjusted to Serbian language. A small-scale questionnaire test with 90 Albanian and ten Serbian speaking students was carried out, which resulted in some changes in the two questionnaires.

When the questionnaire was designed a mistake occurred in the question about how much alcohol that was consumed during the last drinking day (C15). All five beverages were included in the initial sub question about beverages consumed, but the quantity questions were missing for alcopops and cider, which makes the calculation of the total amount consumed not comparable.

In the sub question about how drunk the students were at the last drinking occasion (C15f) the text explaining the endpoint was a mix of English and the local language. In addition to this there were two brackets, one pointing at category 9 and one at 10. These deviances are judged to have made the question incomparable.

An extra response category was added in questions O11 and O12, which makes data not comparable with data from other ESPAD countries.

In the national data-cleaning process 62 questionnaires were defined as invalid and were not included in the dataset that was sent to the ESPAD Databank Manager for cleaning. Data were entered manually. Ten percent of the questionnaires were entered twice. Coding mistakes were corrected, but no important problems were noticed.

RELIABILITY AND VALIDITY

The rate of inconsistency between two questions measuring lifetime use of some substances, which is used as a reliability measure, was highest for use of cigarettes (10%) followed by non-medical use of tranquillisers or sedatives (3%). For the other three substances (cannabis, ecstasy and inhalants) the corresponding figures were 1%.

The average non-response rate for all core variables was the highest among all countries (4.5%).

For cannabis, 32% of the students answered “definitely not” to the question, “If you had used marijuana or hashish, do you think that you would have said so in this questionnaire?”. On this “willingness question”, 8% answered that they had already said that they had used cannabis, which is pretty much

higher than the prevalence figure (2%). It is also worth noticing that as many as 10% did not answer to this question.

The rate of inconsistency among lifetime, past-12-months and past-30-days prevalence rates, which is seen as a validity measure, was 7% for alcohol consumption, 2% for having been drunk and 0–1% for the remaining three variables

Of all students, 0.5% answered that they had used the dummy drug Relevin.

METHODOLOGICAL CONCLUSIONS

Lack of relevant statistics makes some calculated student related figures uncertain. However, it anyhow seems reasonable to assume that the estimated figures of 98% of the 1995 cohort still at school and 91% of the target group covered by the sampling frame are pretty close to the true figures.

Since no information was available in the sampling frame about the number of students in the schools, schools were sampled with a simple random sample. This means that students from small schools were oversampled, which was compensated for in the second sampling step since every second class was sampled. This gave an average of 3.9 classes per school, which is double the recommendation of not sampling more than two classes per school. This most probably means that the cluster effects are larger than in most other ESPAD countries, which needs to be considered in different kinds of statistical tests.

Due to pragmatic problems, the data collection had to be postponed from the spring to the autumn. However, since two grades were included in the sample and since information of month of birth was available, it was possible to redefine the target population to students born from 1 August 1995 to 30 July 1996. This gave an average age of 15.7 years, which is very close to the ESPAD average age of 15.8 years. Yet another advantage of redefining the target population is that no students had experienced an “extra summer”, which would have been the case with half of the students if the “normal” target population of 1995 born students had been kept.

Only two of the sampled schools (5%) refused to participate and school co-operation is judged to have been good.

No student refused to answer the questionnaire. The proportion of students in participating classes who were present at the time of data collection was very high (97%) and student co-operation is judged to have been good.

Of all students answering the questionnaire 55.8% were girls and 44.2% boys, which is lightly more than the plus/minus five percent difference when weighting is recommended. However, since the mentioned figures are close to this recommendation and since the lack of relevant statistics makes it impossible to know whether parts of the skewness could be based on the fact that there were fewer boys than girls in the sampling frame, no weighting has been done.

Besides of five country specific questions the questionnaire contained all core, module and optional questions. This makes it one of the longest forms and the average time of answering the questionnaire (43 minutes) was above the ESPAD average (37 minutes). The length of the questionnaire and the time to answer it are not extremely long, but it can anyhow not be excluded that some students might have got tired towards the end of the questionnaire and, if this is the case, this may have negatively affected the reliability and validity of the answers to the questions at the end of the questionnaire. However, even if this is the case, the results from the questions presented in this report have probably not been affected to any important degree since they were not located at the end of the questionnaire.

Due to some technical mistakes in the questionnaire, data about the amount of alcohol consumed during the last drinking day and the level of intoxication that day (C15f) are not comparable. Also questions O11 and O12 are seen as not comparable.

There were fewer survey leader than average that reported no disturbances during the data collection (62 % and 68% respectively) and the same was true when it comes to the proportion of survey leaders that answered that all or nearly all students worked seriously (77% and 86% respectively). On the other hand, the proportion of students that were judged to have found the form difficult to understand (2%) was lower than average (5%). All in all, these figures don't indicate any major problems during the data collection.

The average non-response rate for all core variables was by far the highest among all countries (4.5%), which creates some concern about the validity. Another indication in this direction is that 10% of the students gave inconsistent answers about cigarette use.

Further, as many as 32% of the students answered that they would “definitely not” admit to possible cannabis use. This is far above the average of 10%. Other countries reporting high figures include

neighbouring countries such as Albania, Bosnia and Herzegovina (Republic of Srpska as well as federation of Bosnia and Herzegovina), Montenegro and Serbia. Even though the question is a hypothetical one, the figures for these countries give rise to some uncertainty and indicate that under-reporting of drug consumption might be higher there than in most other countries. This is also supported by the fact that rather many students either skipped this question (10%) or seem to have misunderstood the first response category.

Overall, the data collection in Kosovo (under UNSCR 1244) seems to have worked well. However, the large proportion of students stating that they would not admit to possible cannabis use, together with the high proportion of unanswered questions, gives rise to some uncertainty and should be kept in mind. Hence, it cannot be excluded that under-reporting of drug use might be higher in Kosovo (under UNSCR 1244), as well as in some neighbouring countries, than in most other countries (even though there is no reason to question that it belongs to the group of countries with a low prevalence of drug use).

NETHERLANDS

The person responsible for the Dutch ESPAD study was Karin Monshouwer from the Trimbos Institute. The Netherlands also participated in the 1999, 2003 and 2007 ESPAD data-collection exercises.

Country facts:
Area: 41 500 km²
Population: 16.8 million

ETHICAL CONSIDERATIONS

No ethical review was necessary. A letter was sent to the parents in which they were informed about the study and the possibility to tell the teacher if they did not want their child to participate. No other ethical considerations were relevant and all national ethical rules were followed.

POPULATION

The population consists of all students in grades 3 and 4 of “regular” secondary education born between 1 August 1995 and 31 July 1996. The reason for this choice of target population, which differs from the one used in other ESPAD countries, is that the data collection in the Netherlands was carried out in October–November, i.e. about 6–7 months later than in most other countries. The redefinition of the target population results in an average age of the Dutch ESPAD students (15.8 years) which is similar to the average age in a large majority of the ESPAD countries.

It has been estimated that about 93% of those born between 1 August 1995 and 31 July 1996 attended a Dutch school at the time of data collection.

SAMPLE AND REPRESENTATIVENESS

Schools were stratified in four strata according to the level of urbanisation. Proportionately to the size of each stratum, schools were sampled within each stratum using a simple random sampling from a list of all schools. Every fourth school was assigned as a school where a grade 3 class would be sampled. At all remaining schools, a grade 4 class would be sampled. Of all students in the target population, 92% were estimated to be found in these two grades.

Schools that agreed to participate in the study sent lists of all grade 3 or 4 classes. These lists were used to draw a simple random sample of one class per school with fewer than 500 students and two classes per school with 500 students or more. After weighting for an underrepresentation of students from grade 3, the sample is judged to be nationally representative of all secondary-school students born between 1 August 1995 and 31 July 1996.

FIELD PROCEDURE

Research assistants were responsible for the data-collection process. The teachers were asked to leave the room or to take a place at the back of the room during data collection. After completion, the questionnaires of all students were put in a large class envelope together with the Classroom Report. The envelopes were sent to the data-entry service.

Data were collected in October and November, which gave an average age of 15.8 years. The average time to complete the questionnaire was 32 minutes.

QUESTIONNAIRE AND DATA PROCESSING

The Dutch questionnaire included all ESPAD core questions as well as one module question and one optional question. Some country-specific questions were also asked, including one about reasons for

drinking, the use of alcohol or cannabis during school hours and one related to music.

The question about heavy episodic drinking (C18) did not contain any definition of what “a drink” is. The question about possible drunkenness among friends (C34c) was related to being drunk at least once a week, while the master questionnaire did not include any frequency measure.

Since the questionnaire was about the same as in 2007 no new translation and back translation was done. Earlier experiences of the ESPAD questionnaire did not indicate any major problems, so the 2011 questionnaire was not pre tested.

SCHOOL AND STUDENT COOPERATION

Out of the 282 sampled schools, 141 agreed to participate. Non-participating schools were on average larger than participating schools (948 versus 753 students), but no differences were found with respect to urbanity. Students from small and large participating schools were compared for six variables (lifetime and last 30 days smoking and use of alcohol and drugs). Except for lifetime smoking (57% in small schools and 51% in large), no significant differences were found.

Schools that did not take part in the study were asked for the reason and the most important were that the school already took part in other research project(s) (31%), that the school had got too many requests to do other surveys (20%) and that the school did not have the time (16%).

Five students refused to participate and one was denied participation by the parents. Of all students in participating classes 93% were present and took part in the survey.

Three out four survey leaders (75%) did not report any disturbances during completion of the forms and 93% answered that “all” or “nearly all” students worked seriously. Nearly none (0%) mentioned that the students found the form difficult to answer.

RELIABILITY AND VALIDITY

The rates of inconsistency between two questions in a single administration, which is used as a reliability measure, were low (1–2%) for all five substances.

The average rate of missing data for all core questions was 0.8%.

The rate of inconsistent answers to questions about lifetime use, use in the past 12 months and use in the past 30 days was low (0–2%) for all five variables (alcohol consumption, having been drunk, cannabis, ecstasy and inhalants).

For cannabis, 8% of the students answered “definitely not” to the question “If you had used marijuana or hashish, do you think you would have said so on the questionnaire?”. On this “willingness question”, 22% answered that they had already said that they had used cannabis, which is relatively close to the reported prevalence figure (27%).

Only a few students (0.7%) answered that they had used the dummy drug “NSTC” (which was used instead of “Relevin”).

METHODOLOGICAL CONSIDERATIONS

For pragmatic and historical reasons, the data-collection process in the Netherlands took place 6–7 months later (in October–November) than in other ESPAD countries (in which data were collected during the winter and spring). To compensate for this, the target population was redefined as students born between 1 August 1995 and 31 July 1996. This results in an average age of 15.8 years, which is about the same as in most other ESPAD countries.

The situation was similar to that in earlier data collections, including the 1999 survey when it was possible to compare the results from students defined in a similar way with students defined according to the ESPAD protocol (Hibell et al. 2000). There were only some minor differences between the two groups and they were all in the expected direction. The conclusion drawn was that the definition of the target population used in the Dutch study seemed to be appropriate for ESPAD comparisons. It seems relevant to make the same assumption with respect also to the 2011 survey.

The differences in the formulation of the question about heavy episodic drinking (C18) and the question about drinking among friends (C34c) are judged to be important enough to undermine comparability.

The sample of schools seems to have been adequate even though grade 3 classes turned out to be under-sampled, which was compensated by weighting. Since schools within each stratum were sampled with a simple random sample, students from small schools were over-represented. This was compensated for by sampling two classes at large schools and only one at small schools.

Of the sampled schools, 50% did not wish to participate. This is a high proportion compared with most other ESPAD countries and higher than in the 2007 Dutch ESPAD survey (45%). A comparison

between participating and non-participating schools showed that non-participating schools on average were larger. However only for one out of six variables (life time smoking) a significant difference was found between students from participating small and large schools.

Hence there appear to be some ground for assuming that the relatively high number of non-participating schools did not influence the results to such a degree that comparability with other ESPAD countries would be jeopardised. However, some uncertainty does of course remain.

Student cooperation was good with only five students refusing to participate, a high proportion of present students and few excluded questionnaires.

No reliability or validity measures indicate any important methodological problems.

Overall, the data from the Dutch survey seem to be comparable with data from other ESPAD countries. However, it might be worth keeping in mind that data collection was carried out at a different time of the year, that the target population is defined differently (even though the mean age is about the same) and that a large number of schools did not wish to participate in the survey.

a) Totally 75% of the students have reported some last day consumption, 16% no such consumption while 10% are inconsistent or non-responding.^{b)}

b) Average percentages related to the number of countries with a calculated total volume.

c) Alcopops: includes also mixed spirits-drinks; Spirits: does not include mixed spirits-drinks.

d) Averages for countries with volumes per beverage. Hence, these volumes can not be summarised into a total average.

a) Totally 75% of the students have reported some last day consumption, 15% no such consumption while 10% are inconsistent or non-responding.

b) Average percentages related to the number of countries with a calculated total volume.

c) Alcopops: includes also mixed spirits-drinks; Spirits: does not include mixed spirits-drinks.

d) Averages for countries with volumes per beverage. Hence, these volumes can not be summarised into a total average.

Question C15.2–6, C15a–e

Table 17c. Estimated average alcohol consumption during the last alcohol drinking day among students reporting any last day alcohol consumption, per beverage and total^{a)}. Girls. 2011.

a) Since 2007 it is clearly stated that alcopops should not be included in this category, but this was not the case between 1995-2003. A 2006 questionnaire test in eight countries showed significant result-differences between this and the recent version. Hence, trend-comparability is therefore broken 2007.

b) Collected data 2008 instead of 2007.

c) Does not include mixed spirits-drinks.

Question C15.2–6, C15a–e

Table 53. Estimated average alcohol consumption during the last alcohol drinking day among students reporting any last day alcohol consumption, per beverage and total. Centiliters of pure alcohol. All students. 2007–2011.

a)"A 'drink' is a glass/bottle/can of beer (ca 50 cl), a glass/bottle/can of cider (ca 50 cl), 2 glasses/bottles of alcopops (ca 50 cl), a glass of wine (ca 15 cl), a glass of spirits (ca 5 cl) or a mixed drink."

b) In 1995–2003 the question referred to "five or more drinks in a row" and nor cider or alcopops were included among the examples. However, a 2006 questionnaire test in eight countries found no significant differences between this and the recent version.

c) Collected data 2008 instead of 2007.

^{a)} Since 2007 cannabis availability is measured separately, but 1995–2003 it was combined with other substances. A 2006 questionnaire test in eight countries showed significant result-differences between this and the recent version. Hence, trend-comparability is therefore broken 2007.

^{b)} Collected data 2008 instead of 2007.

a) "...(glue, etc) in order to get high". The definition of inhalant use was rephrased in the 2007 questionnaire. However, a questionnaire test in eight countries found no significant differences between the old and new version. In 2011 countries were instructed to insert nationally relevant examples.

b) Collected data 2008 instead of 2007.

a) "Without a doctor's prescription".

b) Includes cannabis, ecstasy, amphetamines, LSD or other hallucinogens, crack, cocaine, heroin and (since 2007) GHB.

c) Collected data 2008 instead of 2007.

APPENDIX IV

Student questionnaire

The European School Survey Project on Alcohol and Other Drugs
www.espad.org

Questionnaire on substance use

Read this first please!

This questionnaire is part of an international study on substance use among European students. It will be answered by more than 100,000 students in over 35 countries. The study is called ESPAD.

This is a totally anonymous questionnaire; You should not state your name or any other information which identifies you. You should place your completed questionnaire in the enclosed envelope and seal it yourself. Your [TEACHER/SURVEY LEADER] will collect the envelopes after completion.

Your class has been randomly selected to take part in this study. In [COUNTRY] the survey is carried out by [ORGANISATION]. It is voluntary to take part. If there is any question you find objectionable for any reason, just leave it blank. It is important that you answer as thoughtfully and frankly as possible. The results will not be presented by single classes and remember your answers are totally anonymous.

If you do not find an answer that fits exactly, indicate the one that comes closest. Please, mark the appropriate answer to each question by making an "X" in the box. If you have a question, please raise your hand and your [TEACHER/SURVEY LEADER] will assist you.

Thank you in advance for your participation! Please begin.

LOGO
 FIELD WORK
 ORGANISATION

Contact info to the organisation responsible for the field work/national survey.

The first questions ask for some background information about yourself and the kinds of things you might do.

C01 What is your sex?

- 1 Male
2 Female

C02 When were you born?

Year 19

Month *

(Mark 01 for January, 02 for February ...
... and 12 for December)

* Optional

C03 How often (if at all) do you do each of the following?

Mark one box for each line.

	Never	A few times a year	Once or twice a month	At least once a week	Almost every day
a) Play computer games.....	<input type="checkbox"/>				
b) Actively participate in sports, athletics or exercising	<input type="checkbox"/>				
c) Read books for enjoyment (do not count schoolbooks)	<input type="checkbox"/>				
d) Go out in the evening (to a disco, cafe, party etc)	<input type="checkbox"/>				
e) Other hobbies (play an instrument, sing, draw, write)	<input type="checkbox"/>				
f) Go around with friends to shopping centres, streets, parks etc just for fun.....	<input type="checkbox"/>				
g) Use the Internet for leisure activities (chats, music, games etc)	<input type="checkbox"/>				
h) Play on slot machines (the kind in which you may win money).....	<input type="checkbox"/>				

1 2 3 4 5

C04 During the LAST 30 DAYS on how many days have you missed one or more lessons?

Mark one box for each line.

	None	1 day	2 days	3–4 days	5–6 days	7 days or more
a) Because of illness.....	<input type="checkbox"/>					
b) Because you skipped or "cut"	<input type="checkbox"/>					
c) For other reasons	<input type="checkbox"/>					

1 2 3 4 5 6

C05 Which of the following best describes your average grade at the end of the last term?

- 1 (Highest marks)
2 etc...

C06 How often during the LAST 12 MONTHS have you experienced the following?

Mark one box for each line.

	Number of occasions						
	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) Physical fight	<input type="checkbox"/>						
b) Accident or injury	<input type="checkbox"/>						
c) Serious problems with your parents	<input type="checkbox"/>						
d) Serious problems with your friends	<input type="checkbox"/>						
e) Performed poorly at school or work.....	<input type="checkbox"/>						
f) Victimized by robbery or theft.....	<input type="checkbox"/>						
g) Trouble with police.....	<input type="checkbox"/>						
h) Hospitalised or admitted to an emergency room	<input type="checkbox"/>						
i) Engaged in sexual intercourse without a condom	<input type="checkbox"/>						
j) Engaged in sexual intercourse you regretted the next day	<input type="checkbox"/>						

The following questions are about cigarette smoking

C07 How difficult do you think it would be for you to get cigarettes if you wanted?

- 1 Impossible
 2 Very difficult
 3 Fairly difficult
 4 Fairly easy
 5 Very easy
 6 Don't know

C08 On how many occasions (if any) during your lifetime have you smoked cigarettes?

Number of occasions						
0	1–2	3–5	6–9	10–19	20–39	40 or more
<input type="checkbox"/>						
1	2	3	4	5	6	7

C09 How frequently have you smoked cigarettes during the LAST 30 DAYS?

- 1 Not at all
 2 Less than 1 cigarette per week
 3 Less than 1 cigarette per day
 4 1–5 cigarettes per day
 5 6–10 cigarettes per day
 6 11–20 cigarettes per day
 7 More than 20 cigarettes per day

C10 When (if ever) did you FIRST do each of the following things?

Mark one box for each line.

	Never	9 years old or less	10 years old	11 years old	12 years old	13 years old	14 years old	15 years old	16 years or older
	<input type="checkbox"/>								
a) Smoke your first cigarette	<input type="checkbox"/>								
b) Smoke cigarettes on a daily basis	<input type="checkbox"/>								

The next questions are about alcoholic beverages
– including beer, cider, alcopops (premixed drinks), wine and spirits.

C11 How difficult do you think it would be for you to get each of the following, if you wanted?

Mark one box for each line.

	Impossible	Very difficult	Fairly difficult	Fairly easy	Very easy	Don't know
a) Beer.....	<input type="checkbox"/>					
b) Cider*.....	<input type="checkbox"/>					
c) Alcopops*.....	<input type="checkbox"/>					
d) Wine	<input type="checkbox"/>					
e) Spirits.....	<input type="checkbox"/>					

* Optional

C12 On how many occasions (if any) have you had any alcoholic beverage to drink?

Mark one box for each line.

	Number of occasions						
	0	1-2	3-5	6-9	10-19	20-39	40 or more
a) In your lifetime	<input type="checkbox"/>						
b) During the last 12 months.....	<input type="checkbox"/>						
c) During the last 30 days.....	<input type="checkbox"/>						

C13 Think back over the LAST 30 DAYS. On how many occasions (if any) have you had any of the following to drink?

Mark one box for each line.

	Number of occasions						
	0	1-2	3-5	6-9	10-19	20-39	40 or more
a) Beer.....	<input type="checkbox"/>						
b) Cider*.....	<input type="checkbox"/>						
c) Alcopops*.....	<input type="checkbox"/>						
d) Wine	<input type="checkbox"/>						
e) Spirits.....	<input type="checkbox"/>						

* Optional

The following questions are about the last day you drank alcohol.

C14 When was the last day you drank alcohol?

- 1 I never drink alcohol
- 2 1-7 days ago
- 3 8-14 days ago
- 4 15-30 days ago
- 5 1 month – 1 year ago
- 6 More than 1 year ago

C15 Think of the LAST DAY that you drank any alcohol. Which of the following beverages did you drink on that day?

Mark all that apply.

- 1 I never drink alcohol
- 1 Beer
- 1 Cider*
- 1 Alcopops*
- 1 Wine
- 1 Spirits

* Optional

C15a If you drank beer that last day you drank any alcohol, how much did you drink?

- 1 I never drink beer
- 2 I did not drink beer on the last day that I drank alcohol
- 3 <50 cl
- 4 50–100 cl
- 5 101–200 cl
- 6 >200 cl

C15d If you drank wine that last day you drank any alcohol, how much did you drink?

- 1 I never drink wine
- 2 I did not drink wine on the last day that I drank alcohol
- 3 <20 cl
- 4 20–40 cl
- 5 41–74 cl
- 6 >74 cl

OC15b If you drank cider that last day you drank any alcohol, how much did you drink? *

- 1 I never drink cider
- 2 I did not drink cider on the last day that I drank alcohol
- 3 <50 cl
- 4 50–100 cl
- 5 101–200 cl
- 6 >200 cl

OC15c If you drank alcopops that last day you drank any alcohol, how much did you drink? *

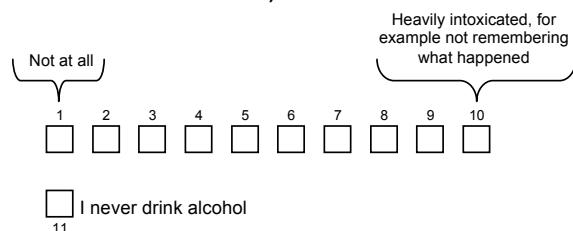

- 1 I never drink alcopops
- 2 I did not drink alcopops on the last day that I drank alcohol
- 3 <50 cl
- 4 50–100 cl
- 5 101–200 cl
- 6 >200 cl

* Optional

C15e If you drank spirits that last day you drank any alcohol, how much did you drink?

- 1 I never drink spirits
- 2 I did not drink spirits on the last day that I drank alcohol
- 3 <8 cl
- 4 8–15 cl
- 5 16–24 cl
- 6 >24 cl

C15f Please indicate on this scale from 1 to 10 how drunk you would say you were that last day you drank alcohol. (If you felt no effect at all you should mark "1".)

The next questions are about alcohol consumption during the last 30 days.

C16 Think back over the LAST 30 DAYS. On how many occasions (if any) have you bought beer, cider, alcopops, wine or spirits in a store (grocery store, liquor store, kiosk or petrol station) for your own consumption (off-premise)?

Mark one box for each line.

	Number of occasions					
	0	1–2	3–5	6–9	10–19	20 or more
a) Beer	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Cider*	<input checked="" type="checkbox"/>	<input type="checkbox"/>				
c) Alcopops*	<input checked="" type="checkbox"/>	<input type="checkbox"/>				
d) Wine	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Spirits.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

* Optional

C17 Think back once more over the LAST 30 DAYS. On how many occasions (if any) have you drunk beer, cider, alcopops, wine or spirits in a pub, bar, restaurant or disco (on-premise)?

Mark one box for each line.

	Number of occasions					
	0	1–2	3–5	6–9	10–19	20 or more
a) Beer	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Cider*	<input checked="" type="checkbox"/>	<input type="checkbox"/>				
c) Alcopops*	<input checked="" type="checkbox"/>	<input type="checkbox"/>				
d) Wine	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Spirits.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

* Optional

C18 Think back again over the LAST 30 DAYS. How many times (if any) have you had five or more drinks on one occasion? (A "drink" is [INSERT NATIONALLY RELEVANT EXAMPLES].)

- 1 None
- 2 1
- 3 2
- 4 3–5
- 5 6–9
- 6 10 or more times

The next couple of questions are also about alcohol.

C19 On how many occasions (if any) have you been intoxicated from drinking alcoholic beverages, for example staggered when walking, not being able to speak properly, throwing up or not remembering what happened?

Mark one box for each line.

	Number of occasions						
	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) In your lifetime	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) During the last 12 months.....	<input checked="" type="checkbox"/>	<input type="checkbox"/>					
c) During the last 30 days.....	<input checked="" type="checkbox"/>	<input type="checkbox"/>					

C20 When (if ever) did you FIRST do each of the following things?

Mark one box for each line.

	Never	9 years old or less	10 years old	11 years old	12 years old	13 years old	14 years old	15 years old	16 years or older
a) Drink beer (at least one glass).....	<input type="checkbox"/>								
b) Drink cider (at least one glass)*.....	<input checked="" type="checkbox"/>								
c) Drink alcops (at least one glass)*.....	<input checked="" type="checkbox"/>								
d) Drink wine (at least one glass)	<input type="checkbox"/>								
e) Drink spirits (at least one glass)	<input type="checkbox"/>								
f) Get drunk on alcohol	<input type="checkbox"/>								

* Optional

C21 How likely is it that each of the following things would happen to you personally, if you drink alcohol?

Mark one box for each line.

	Very likely	Likely	Unsure	Unlikely	Very unlikely
a) Feel relaxed.....	<input type="checkbox"/>				
b) Get into trouble with police	<input type="checkbox"/>				
c) Harm my health	<input type="checkbox"/>				
d) Feel happy.....	<input type="checkbox"/>				
e) Forget my problems.....	<input type="checkbox"/>				
f) Not be able to stop drinking.....	<input type="checkbox"/>				
g) Get a hangover.....	<input type="checkbox"/>				
h) Feel more friendly and outgoing.....	<input type="checkbox"/>				
i) Do something I would regret.....	<input type="checkbox"/>				
j) Have a lot of fun.....	<input type="checkbox"/>				
k) Feel sick.....	<input type="checkbox"/>				

C22 BECAUSE OF YOUR OWN ALCOHOL USE, how often during the LAST 12 MONTHS have you experienced the following?

If you haven't used alcohol the last 12 months, please mark zero occasions on all questions.

Mark one box for each line.

	Number of occasions						
	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) Physical fight	<input type="checkbox"/>						
b) Accident or injury	<input type="checkbox"/>						
c) Serious problems with your parents	<input type="checkbox"/>						
d) Serious problems with your friends	<input type="checkbox"/>						
e) Performed poorly at school or work	<input type="checkbox"/>						
f) Victimized by robbery or theft	<input type="checkbox"/>						
g) Trouble with police	<input type="checkbox"/>						
h) Hospitalised or admitted to an emergency room	<input type="checkbox"/>						
i) Engaged in sexual intercourse without a condom	<input type="checkbox"/>						
j) Engaged in sexual intercourse you regretted the next day	<input type="checkbox"/>						

Tranquillisers and sedatives, like [INSERT NATIONALLY RELEVANT EXAMPLES], are sometimes prescribed by doctors to help people to calm down, get to sleep or to relax. Pharmacies are not supposed to sell them without a prescription.

C23 Have you ever taken tranquillisers or sedatives because a doctor told you to take them?

- 1 No, never
- 2 Yes, but for less than 3 weeks
- 3 Yes, for 3 weeks or more

The next questions ask about marijuana or hashish (cannabis).

C24 How difficult do you think it would be for you to get marijuana or hashish (cannabis) if you wanted?

- 1 Impossible
- 2 Very difficult
- 3 Fairly difficult
- 4 Fairly easy
- 5 Very easy
- 6 Don't know

C25 On how many occasions (if any) have you used marijuana or hashish (cannabis)?

Mark one box for each line.

Number of occasions

	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) In your lifetime	<input type="checkbox"/>						
b) During the last 12 months.....	<input type="checkbox"/>						
c) During the last 30 days.....	<input type="checkbox"/>						
	1	2	3	4	5	6	7

C26 When (if ever) did you FIRST try marijuana or hashish (cannabis)?

- 1 Never
- 2 9 years old or less
- 3 10 years old
- 4 11 years old
- 5 12 years old
- 6 13 years old
- 7 14 years old
- 8 15 years old
- 9 16 years or older

C27 Have you ever had the possibility to try marijuana or hashish (cannabis) without trying it?

- 1 No
- 2 Yes

→ **How many times has this happened in your life?**

- 1 1–2
- 2 3–5
- 3 6–9
- 4 10–19
- 5 20–39
- 6 40 or more

The next questions ask about some other drugs.

C28 How difficult do you think it would be for you to get each of the following, if you wanted?

Mark one box for each line.

	Impossible	Very difficult	Fairly difficult	Fairly easy	Very easy	Don't know
a) Amphetamines.....	<input type="checkbox"/>					
b) Tranquillisers or sedatives.....	<input type="checkbox"/>					
c) Ecstasy	<input type="checkbox"/>					
	1	2	3	4	5	6

C29 On how many occasions (if any) have you used ecstasy?

Mark one box for each line.

	Number of occasions						
	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) In your lifetime	<input type="checkbox"/>						
b) During the last 12 months.....	<input type="checkbox"/>						
c) During the last 30 days	<input type="checkbox"/>						
	1	2	3	4	5	6	7

C30 On how many occasions (if any) have you used inhalants [INSERT NATIONALLY RELEVANT EXAMPLES] to get high?

Mark one box for each line.

	Number of occasions						
	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) In your lifetime	<input type="checkbox"/>						
b) During the last 12 months.....	<input type="checkbox"/>						
c) During the last 30 days	<input type="checkbox"/>						
	1	2	3	4	5	6	7

C31 On how many occasions in your lifetime (if any) have you used any of the following drugs?

Mark one box for each line.

	Number of occasions						
	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) Tranquillisers or sedatives (without a doctor's prescription).....	<input type="checkbox"/>						
b) Amphetamines.....	<input type="checkbox"/>						
c) LSD or some other hallucinogens.....	<input type="checkbox"/>						
d) Crack	<input type="checkbox"/>						
e) Cocaine	<input type="checkbox"/>						
f) Relevin.....	<input type="checkbox"/>						
g) Heroin	<input type="checkbox"/>						
h) "Magic mushrooms"	<input type="checkbox"/>						
i) GHB	<input type="checkbox"/>						
j) Anabolic steroids	<input type="checkbox"/>						
k) Drugs by injection with a needle (like heroin, cocaine, amphetamine).....	<input type="checkbox"/>						
l) Alcohol together with pills (medicaments) in order to get high	<input type="checkbox"/>						
m) Optional drug*	<input type="checkbox"/>						
	1	2	3	4	5	6	7

* Optional

C32 When (if ever) did you FIRST do each of the following things?

Mark one box for each line.

	Never	9 years old or less	10 years old	11 years old	12 years old	13 years old	14 years old	15 years old	16 years or older
a) Try tranquillisers or sedatives (without a doctor's prescription)	<input type="checkbox"/>								
b) Try amphetamines.....	<input type="checkbox"/>								
c) Try ecstasy	<input type="checkbox"/>								
d) Try inhalants [INSERT NATIONALLY RELEVANT EXAMPLES] in order to get high	<input type="checkbox"/>								
e) Try alcohol together with pills (medicaments) in order to get high.....	<input type="checkbox"/>								
	1	2	3	4	5	6	7	8	9

The next questions ask about various substances.

C33 Think back of the LAST 30 DAYS. How much money have you spent on tobacco, alcohol and cannabis? If you haven't spent money on one or more of these substances during the last 30 days, please respond 0 on the relevant sub question(s).

- a) Tobacco: [INSERT NATIONAL CURRENCY]
- b) Alcohol: [INSERT NATIONAL CURRENCY]
- c) Cannabis: [INSERT NATIONAL CURRENCY]

C34 How many of your friends would you estimate...

Mark one box for each line.

	None	A few	Some	Most	All
a) smoke cigarettes	<input type="checkbox"/>				
b) drink alcoholic beverages (beer, cider, alcopops, wine, spirits)	<input type="checkbox"/>				
c) get drunk.....	<input type="checkbox"/>				
d) smoke marijuana or hashish (cannabis).....	<input type="checkbox"/>				
e) take tranquillisers or sedatives (without a doctor's prescription)	<input type="checkbox"/>				
f) take ecstasy.....	<input type="checkbox"/>				
g) use inhalants	<input type="checkbox"/>				

1 2 3 4 5

C35 Do any of your older siblings ...

Mark one box for each line.

	Yes	No	Don't know	Don't have any older siblings
a) smoke cigarettes	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) drink alcoholic beverages (beer, cider, alcopops, wine, spirits)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) get drunk.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) smoke marijuana or hashish (cannabis)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) take tranquillisers or sedatives (without a doctor's prescription)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) take ecstasy.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) use inhalants	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

1 2 3 4

C36 How much do you think PEOPLE RISK harming themselves (physically or in other ways), if they ...

Mark one box for each line.

	No risk	Slight risk	Moderate risk	Great risk	Don't know
a) smoke cigarettes occasionally.....	<input type="checkbox"/>				
b) smoke one or more packs of cigarettes per day.....	<input type="checkbox"/>				
c) have one or two drinks nearly every day	<input type="checkbox"/>				
d) have four or five drinks nearly every day	<input type="checkbox"/>				
e) have five or more drinks each weekend	<input type="checkbox"/>				
f) try marijuana or hashish (cannabis) once or twice	<input type="checkbox"/>				
g) smoke marijuana or hashish (cannabis) occasionally	<input type="checkbox"/>				
h) smoke marijuana or hashish (cannabis) regularly	<input type="checkbox"/>				
i) try ecstasy once or twice	<input type="checkbox"/>				
j) take ecstasy regularly	<input type="checkbox"/>				
k) try an amphetamine (uppers, pep pills, bennie, speed) once or twice	<input type="checkbox"/>				
l) take amphetamines regularly.....	<input type="checkbox"/>				

1 2 3 4 5

The next questions ask about your parents. If mostly foster parents, step-parents or others brought you up answer for them. For example, if you have both a stepfather and a natural father, answer for the one that is the most important in bringing you up.

C37 What is the highest level of schooling your father completed?

- 1 Completed primary school or less
- 2 Some secondary school
- 3 Completed secondary school
- 4 Some college or university
- 5 Completed college or university
- 6 Don't know
- 7 Does not apply

C38 What is the highest level of schooling your mother completed?

- 1 Completed primary school or less
- 2 Some secondary school
- 3 Completed secondary school
- 4 Some college or university
- 5 Completed college or university
- 6 Don't know
- 7 Does not apply

C39 How well off is your family compared to other families in your country?

- 1 Very much better off
- 2 Much better off
- 3 Better off
- 4 About the same
- 5 Less well off
- 6 Much less well off
- 7 Very much less well off

C40 Which of the following people live in the same household with you?

Mark all that apply.

- 1 I live alone
- 1 Father
- 1 Stepfather
- 1 Mother
- 1 Stepmother
- 1 Brother(s)
- 1 Sister(s)
- 1 Grandparent(s)
- 1 Other relative(s)
- 1 Non-relative(s)

C41 How satisfied are you usually with ...

Mark one box for each line.

	Very satisfied	Satisfied	Neither nor	Not so satisfied	Not at all satisfied	There is no such person
a) your relationship with your mother?.....	<input type="checkbox"/>					
b) your relationship with your father?.....	<input type="checkbox"/>					
c) your relationship with your friends?.....	<input type="checkbox"/>					
	1	2	3	4	5	6

C42 How often do the following statements apply to you?

Mark one box for each line.

	Almost always	Often	Some- times	Seldom	Almost never
a) My parent(s) set definite rules about what I can do at home.....	<input type="checkbox"/>				
b) My parent(s) set definite rules about what I can do outside the home	<input type="checkbox"/>				
c) My parent(s) know whom I am with in the evenings.....	<input type="checkbox"/>				
d) My parent(s) know where I am in the evenings.....	<input type="checkbox"/>				
e) I can easily get warmth and caring from my mother and/or father	<input type="checkbox"/>				
f) I can easily get emotional support from my mother and/or father	<input type="checkbox"/>				
g) I can easily borrow money from my mother and/or father	<input type="checkbox"/>				
h) I can easily get money as a gift from my mother and/or father	<input type="checkbox"/>				
i) I can easily get warmth and caring from my best friend	<input type="checkbox"/>				
j) I can easily get emotional support from my best friend	<input type="checkbox"/>				
	1	2	3	4	5

C43 Do your parents know where you spend Saturday nights?

- 1 Know always
 2 Know quite often
 3 Know sometimes
 4 Usually don't know

C44 If you had ever used marijuana or hashish (cannabis), do you think that you would have said so in this questionnaire?

- 1 I already said that I have used it
 2 Definitely yes
 3 Probably yes
 4 Probably not
 5 Definitely not

The next section includes questions about your parents' thoughts about alcohol and drug use.

MA1 If you wanted to smoke (or already do), do you think your father and mother would allow you to do so?

Mark one box for each line.

	Would allow (allows) me to smoke	Would not (does not) allow smoking at home	Would not (does not) allow smoking at all	Don't know
a) Father	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Mother	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	1	2	3	4

MA2 What do you think your mother's reaction would be if you do the following things?

Mark one box for each line.

	She would not allow it	She would discourage it	She would not mind	She would approve of it	Don't know
a) Get drunk.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Use marijuana/hashish.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Use ecstasy	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	1	2	3	4	5

MA3 What do you think your father's reaction would be if you do the following things?

Mark one box for each line.

	He would not allow it	He would discourage it	He would not mind	He would approve of it	Don't know
a) Get drunk.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Use marijuana/hashish.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Use ecstasy	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	1	2	3	4	5

MA4 How satisfied are you usually with ...

Mark one box for each line.

	Very satisfied	Satisfied	Neither satisfied or not satisfied	Not so satisfied	Not at all satisfied
a) the financial situation of your family?.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) your health?.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) yourself?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	1	2	3	4	5

MA5 How much money do you usually spend a week for your personal needs without your parents' control?

<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
--------------------------	--------------------------	--------------------------	--------------------------

[INSERT NATIONAL CURRENCY]

The following section is about what you think of yourself.

MB1 Below is a list of statements dealing with your general feelings about yourself.

Mark one box for each line to indicate if you agree or disagree.

	Strongly agree	Agree	Disagree	Strongly disagree
a) On the whole, I am satisfied with myself	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) At times I think I am no good at all	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) I feel that I have a number of good qualities.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) I am able to do things as well as most other people.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) I feel I do not have much to be proud of.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) I certainly feel useless at times.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) I feel that I'm a person of worth, at least on an equal plane with others.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
h) I wish I could have more respect for myself	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
i) All in all, I am inclined to feel that I am a failure.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
j) I take a positive attitude toward myself.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	1	2	3	4

MB2 During the LAST 7 DAYS, how often

Mark one box for each line.

	Rarely or never	Some- times	Several times	Most of the times
a) have you lost your appetite, you did not want to eat	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) have you had difficulty in concentrating on what you want to do	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) have you felt depressed.....	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) have you felt that you had to put great effort and pressure to do the things you had to do	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) have you felt sad	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) couldn't you do your work (at home, at work, at school)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
	1	2	3	4

MB3 How much do you agree or disagree with the following statements?

Mark one box for each line.

	Totally agree	Rather agree	Don't know	Rather disagree	Totally disagree
a) You can break most rules if they don't seem to apply	<input type="checkbox"/>				
b) I follow whatever rules I want to follow	<input type="checkbox"/>				
c) In fact there are very few rules absolute in life	<input type="checkbox"/>				
d) It is difficult to trust anything, because everything changes	<input type="checkbox"/>				
e) In fact nobody knows what is expected of him/her in life.....	<input type="checkbox"/>				
f) You can never be certain of anything in life.....	<input type="checkbox"/>				

1 2 3 4 5

The following questions concern behaviours, which may be against some social rules or the law. We hope that you will answer all the questions. Nevertheless, if you come across a question, which you cannot answer honestly, we prefer that you leave it unanswered. Remember that your answers are anonymous.

MB4 During the LAST 12 MONTHS, how often have you ...

Mark one box for each line.

	Number of occasions				
	Not at all	Once	Twice	3–4 times	5 or more times
a) hit one of your teachers	<input type="checkbox"/>				
b) got mixed into a fight at school or at work	<input type="checkbox"/>				
c) taken part in a fight where a group of your friends were against another group.....	<input type="checkbox"/>				
d) hurt somebody badly enough to need bandages or a doctor	<input type="checkbox"/>				
e) used any kind of weapon to get something from a person.....	<input type="checkbox"/>				
f) taken something not belonging to you, worth over (the equivalent of) \$ 10	<input type="checkbox"/>				
g) taken something from a shop without paying for it	<input type="checkbox"/>				
h) set fire to somebody else's property on purpose.....	<input type="checkbox"/>				
i) damaged school property on purpose	<input type="checkbox"/>				
j) got into trouble with the police for something you did.....	<input type="checkbox"/>				

1 2 3 4 5

MB5 Has any of the following ever happened to you?

Mark one box for each line.

	Number of occasions				
	Not at all	Once	Twice	3–4 times	5 or more times
a) Run away from home for more than one day	<input type="checkbox"/>				
b) Thought of harming yourself.....	<input type="checkbox"/>				
c) Attempted suicide	<input type="checkbox"/>				

1 2 3 4 5

MB6 If you have attempted suicide, did any suicide attempt result in treatment by a doctor or a nurse?1 I have not attempted suicide2 Yes3 No

The following questions concern behaviours, which may be against some social rules or the law. We hope that you will answer all the questions. Nevertheless, if you come across a question, which you cannot answer honestly, we prefer that you leave it unanswered. Remember that your answers are anonymous.

MC1 During the LAST 12 MONTHS, how often have you ...

Mark one box for each line.

	Number of occasions						
	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) participated in a group teasing an individual	<input type="checkbox"/>						
b) participated in a group bruising an individual	<input type="checkbox"/>						
c) participated in a group starting a fight with another group.....	<input type="checkbox"/>						
d) started a fight with another individual	<input type="checkbox"/>						
e) stolen something worth (give a rounded sum approx equivalent to 2–3 movie theatre tickets).....	<input type="checkbox"/>						
f) broken into a place to steal.....	<input type="checkbox"/>						
g) damaged public or private property on purpose.....	<input type="checkbox"/>						
h) sold stolen goods.....	<input type="checkbox"/>						
	1	2	3	4	5	6	7

MC2 During the LAST 12 MONTHS, how often have you ...

Mark one box for each line.

	Number of occasions						
	0	1–2	3–5	6–9	10–19	20–39	40 or more
a) been individually teased by a whole group of people.....	<input type="checkbox"/>						
b) been bruised by a whole group of people	<input type="checkbox"/>						
c) been in a group that was attacked by another group	<input type="checkbox"/>						
d) had someone start a fight with you individually	<input type="checkbox"/>						
e) had something worth (give a rounded sum approx equivalent to 2–3 movie theatre tickets) stolen from you	<input type="checkbox"/>						
f) had someone break into your home to steal something.....	<input type="checkbox"/>						
g) had someone damage your belongings on purpose	<input type="checkbox"/>						
h) bought stolen goods	<input type="checkbox"/>						
	1	2	3	4	5	6	7

This section includes some more questions about cannabis.

MD1 Have you used cannabis during the LAST 12 MONTHS?

1 No

2 Yes → Has the following happened to you during the LAST 12 MONTHS?

Mark one box for each line.

	Never	Rarely	From time to time	Fairly often	Very often
a) Have you smoked cannabis before midday?	<input type="checkbox"/>				
b) Have you smoked cannabis when you were alone?.....	<input type="checkbox"/>				
c) Have you had memory problems when you smoked cannabis?	<input type="checkbox"/>				
d) Have friends or members of your family told you that you ought to reduce or stop your cannabis use?	<input type="checkbox"/>				
e) Have you tried to reduce or stop your cannabis use without succeeding?	<input type="checkbox"/>				
f) Have you had problems because of your use of cannabis (argument, fight, accident, bad result at school, etc)?	<input type="checkbox"/>				
Which:	1	2	3	4	5

MD2 Are you part of a clique of friends, where using cannabis is part of your behaviour when you meet?

1 No
2 Yes

→ **How often per month do you meet with members of this clique?**

- 1 (Almost) daily
2 3–4 times a week
3 1–2 times a week
4 1–3 times a month
5 Less than once a month

The next questions ask once more about cannabis.

O1 In which of the following places do you think you could easily buy marijuana or hashish (cannabis) if you wanted to?

Mark all that apply.

- 1 I don't know of any such place
1 Street, park etc
1 School
1 Disco, bar etc
1 House of a dealer
1 Via the Internet
1 Coffee shop*
1 Other(s), please specify

* Optional

O2 How likely is it that each of the following would happen to you if you use marijuana or hashish (cannabis)?

Mark one box for each line.

	Not at all	Unlikely	Maybe	Quite likely	Definitely
a) I perceive things more intensely.....	<input type="checkbox"/>				
b) I can no longer follow a conversation properly	<input type="checkbox"/>				
c) I lose thread more quickly.....	<input type="checkbox"/>				
d) I am not so shy	<input type="checkbox"/>				
e) I have difficulty concentrating	<input type="checkbox"/>				
f) I am more outgoing.....	<input type="checkbox"/>				
g) I can enjoy the moment more intensely.....	<input type="checkbox"/>				
h) I experience feelings more intensely	<input type="checkbox"/>				
i) I am less inhibited	<input type="checkbox"/>				
j) I may feel people are against me or persecuting me.....	<input type="checkbox"/>				

We want to find out how people begin to take illegal drugs. We want you to think back to the very first occasion (if any) on which you took any of them and tell us about it. (Let us say again that any information you choose to give us about this will be strictly confidential/anonymous. Your name is not on this questionnaire and nobody can find it out).

O3 If you have ever used any illegal drug like marijuana or hashish (cannabis), ecstasy or amphetamines, how did you get it?

Mark all that apply.

- I have never used any illegal drug like marijuana or hashish (cannabis), ecstasy or amphetamines
- Given to me by an older brother or sister
- Given to me by a friend, a boy or a girl, older than me
- Given to me by a friend my own age or younger
- Given to me by someone I have heard about but did not know personally
- Given to me by a stranger
- It was shared around a group of friends
- Bought from a friend
- Bought from someone I have heard about but did not know personally
- Bought from a stranger
- Given to me by one of my parents
- Took it at home without my parents permission
- None of these (please describe briefly how you did get it).....
.....

O4 What was (what were) the reason(s) for you to try this drug?

Mark all that apply.

- I have never used any illegal drug like marijuana or hashish (cannabis), amphetamines or ecstasy
- I wanted to feel high
- I did not want to stand out from the group
- I had nothing to do
- I was curious
- I wanted to forget my problems
- Other reason(s), please specify.....
- Don't remember

This section of the questionnaire includes some more questions about alcohol.

O5 Think back over the LAST 30 DAYS. On how many days have you had any alcohol such as beer, cider, alcopops, wine or spirits to drink?

- Never during the last 30 days
- 1 day during the last 30 days
- 2 days during the last 30 days
- 3 days during the last 30 days
- 1 day a week
- 2 days a week
- 3–4 days a week
- Every day or nearly every day during the last 30 days

O6 On a typical day during the LAST 30 DAYS when you drank alcohol such as beer, cider, alcopops, wine or spirits, how many drinks did you have? (A “drink” is approximately a glass/bottle/can of beer (25–33 cl), a glass/bottle/can of cider (25–33 cl), a bottle of alcopops (27 cl), a glass of wine (10–12.5 cl) or a glass of spirits (4 cl)).

- 1 I never drink alcohol
- 2 I have not been drinking alcohol during the last 30 days
- 3 1 drink
- 4 2 drinks
- 5 3 drinks
- 6 4 drinks
- 7 5 drinks
- 8 6 drinks
- 9 7 drinks
- 10 8 drinks
- 11 9 drinks
- 12 10 or more drinks

O7 Do you think that heavy drinking influences the following problems?

Mark one box for each line.

	Yes, considerably	Yes, quite a lot	Yes, to some extent	Yes, but only a little	No
a) Traffic accidents	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
b) Other accidents	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
c) Violent crime	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
d) Family problems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
e) Health problems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
f) Relationship problems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
g) Financial problems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

O8 Think of that last day on which you drank alcohol. Where were you when you drank?

Mark all that apply.

- 1 I never drink alcohol
- 1 At home
- 1 At someone else's home
- 1 Out on the street, in a park, beach or other open area
- 1 At a bar or a pub
- 1 In a disco
- 1 In a restaurant
- 1 Other places (please describe)

O9 Think back again over the LAST 30 DAYS. How many times (if any) have you been drinking alcohol equivalent to at least [INSERT NATIONALLY RELEVANT EXAMPLES].

- 1 None
- 2 1
- 3 2
- 4 3–5
- 5 6–9
- 6 10 or more times

O10 In your view, does a person close to you drink excessively?

- 1 No
 - 2 Yes —————→ Has this caused harm or problems in your life?
- 1 No
 - 2 Yes

The next two questions are about gambling.

O11 Have you ever felt the need to bet more and more money?

- 1 No
- 2 Yes

O12 Have you ever had to lie to people important to you about how much you gambled?

- 1 No
- 2 Yes

The following questions are about yourself and things you might do.

O13 What house work do you usually do at home?

- 1 I do shopping
- 1 I take care of younger sisters/brothers
- 1 I take care of pets
- 1 I cook
- 1 I clean the house/apartment
- 1 I do laundry
- 1 I wash dishes
- 1 I work on the household plot of land (garden)
- 1 I take care of farm animals
- 1 I care for elder family members
- 1 I take out the rubbish
- 1 I don't usually do any house work

O14 How much TV or video do you estimate you watch on an average weekday?

- 1 None
- 2 Half-hour or less
- 3 About 1 hour
- 4 About 2 hours
- 5 About 3 hours
- 6 About 4 hours
- 7 5 hours or more

O15 How good do you think you are at schoolwork, compared to other people your age?

- 1 Excellent, I am probably one of the very best
- 2 Well above average
- 3 Above average
- 4 Average
- 5 Below average
- 6 Well below average
- 7 Poor, I am probably one of the worst

The European School Survey Project on Alcohol and Other Drugs (ESPAD) is a collaborative effort of independent research teams in more than forty European countries, making it the largest cross-national research project on adolescent substance use in the world.

ESPAD was founded in 1993, on the initiative of the Swedish Council for Information on Alcohol and Other Drugs (CAN) and with the support of the Pompidou Group at the Council of Europe. In later years, ESPAD has also established co-operation with the European Monitoring Centre for Drugs and Drug Addiction (EMCDDA), a body of the European Union.

Most of the European continent is now covered by ESPAD, meaning that it provides a reliable overview of trends in substance use among 15–16-year-old European students. Data are collected every four years. This supplement to the 2011 ESPAD Report presents the results from the fifth wave, conducted in 38 countries during 2011. It gives a comprehensive picture of the present situation among European young people as regards the use of tobacco, alcohol, cannabis and other substances, as well as an overview of trends in 1995–2011.

2011 ESPAD Countries in the report

	Albania		Greece		Netherlands
	Belgium		Hungary		Norway
	Bosnia and Herzegovina		Iceland		Poland
	Bulgaria		Ireland		Portugal
	Croatia		Italy		Romania
	Cyprus		Kosovo (under UNSCR 1244)		Russian Federation
	Czech Republic		Latvia		Serbia
	Denmark		Liechtenstein		Slovak Republic
	Estonia		Lithuania		Slovenia
	Faroe Islands		Malta		Sweden
	Finland		Moldova, Rep. of		Ukraine
	France		Monaco		United Kingdom
	Germany		Montenegro
